- Error: 1494 SQLSTATE: HY000 (ER\_INCONSISTENT\_TYPE\_OF\_FUNCTIONS\_ERROR)

Message: VALUES value must be of same type as partition function

- Error: 1495 SQLSTATE: HY000 (ER\_MULTIPLE\_DEF\_CONST\_IN\_LIST\_PART\_ERROR)

Message: Multiple definition of same constant in list partitioning

- Error: 1496 SQLSTATE: HY000 (ER\_PARTITION\_ENTRY\_ERROR)

Message: Partitioning can not be used stand-alone in query

- Error: 1497 SQLSTATE: HY000 (ER\_MIX\_HANDLER\_ERROR)

Message: The mix of handlers in the partitions is not allowed in this version of MySQL

- Error: 1498 SQLSTATE: HY000 (ER\_PARTITION\_NOT\_DEFINED\_ERROR)

Message: For the partitioned engine it is necessary to define all %s

- Error: 1499 SQLSTATE: HY000 (ER\_TOO\_MANY\_PARTITIONS\_ERROR)

Message: Too many partitions (including subpartitions) were defined

- Error: 1500 SQLSTATE: HY000 (ER\_SUBPARTITION\_ERROR)

Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning

- Error: 1501 SQLSTATE: HY000 (ER\_CANT\_CREATE\_HANDLER\_FILE)

Message: Failed to create specific handler file

- Error: 1502 SQLSTATE: HY000 (ER\_BLOB\_FIELD\_IN\_PART\_FUNC\_ERROR)

Message: A BLOB field is not allowed in partition function

- Error: 1503 SQLSTATE: HY000 (ER\_UNIQUE\_KEY\_NEED\_ALL\_FIELDS\_IN\_PF)

Message: A %s must include all columns in the table's partitioning function

- Error: 1504 SQLSTATE: HY000 (ER\_NO\_PARTS\_ERROR)

Message: Number of %s = 0 is not an allowed value

- Error: 1505 SQLSTATE: HY000 (ER\_PARTITION\_MGMT\_ON\_NONPARTITIONED)

Message: Partition management on a not partitioned table is not possible

- Error: 1506 SQLSTATE: HY000 (ER\_FOREIGN\_KEY\_ON\_PARTITIONED)

Message: Foreign keys are not yet supported in conjunction with partitioning

- Error: 1507 SQLSTATE: HY000 (ER\_DROP\_PARTITION\_NON\_EXISTENT)

Message: Error in list of partitions to %s

- Error: 1508 SQLSTATE: HY000 (ER\_DROP\_LAST\_PARTITION)

Message: Cannot remove all partitions, use DROP TABLE instead

- Error: 1509 SQLSTATE: HY000 (ER\_COALESCE\_ONLY\_ON\_HASH\_PARTITION)

Message: COALESCE PARTITION can only be used on HASH/KEY partitions

- Error: 1510 SQLSTATE: HY000 (ER\_REORG\_HASH\_ONLY\_ON\_SAME\_NO)

Message: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers

- Error: 1511 SQLSTATE: HY000 (ER\_REORG\_NO\_PARAM\_ERROR)

Message: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONS

- Error: 1512 SQLSTATE: HY000 (ER\_ONLY\_ON\_RANGE\_LIST\_PARTITION)

Message: %s PARTITION can only be used on RANGE/LIST partitions

- Error: 1513 SQLSTATE: HY000 (ER\_ADD\_PARTITION\_SUBPART\_ERROR)

Message: Trying to Add partition(s) with wrong number of subpartitions

- Error: 1514 SQLSTATE: HY000 (ER\_ADD\_PARTITION\_NO\_NEW\_PARTITION)

Message: At least one partition must be added

- Error: 1515 SQLSTATE: HY000 (ER\_COALESCE\_PARTITION\_NO\_PARTITION)

Message: At least one partition must be coalesced

- Error: 1516 SQLSTATE: HY000 (ER\_REORG\_PARTITION\_NOT\_EXIST)

Message: More partitions to reorganize than there are partitions

- Error: 1517 SQLSTATE: HY000 (ER\_SAME\_NAME\_PARTITION)

Message: Duplicate partition name %s

- Error: 1518 SQLSTATE: HY000 (ER\_NO\_BINLOG\_ERROR)

Message: It is not allowed to shut off binlog on this command

- Error: 1519 SQLSTATE: HY000 (ER\_CONSECUTIVE\_REORG\_PARTITIONS)

Message: When reorganizing a set of partitions they must be in consecutive order

- Error: 1520 SQLSTATE: HY000 (ER\_REORG\_OUTSIDE\_RANGE)

Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range

- Error: 1521 SQLSTATE: HY000 (ER\_PARTITION\_FUNCTION\_FAILURE)

Message: Partition function not supported in this version for this handler

- Error: 1522 SQLSTATE: HY000 (ER\_PART\_STATE\_ERROR)

Message: Partition state cannot be defined from CREATE/ALTER TABLE

- Error: 1523 SQLSTATE: HY000 (ER\_LIMITED\_PART\_RANGE)

Message: The %s handler only supports 32 bit integers in VALUES

- Error: 1524 SQLSTATE: HY000 (ER\_PLUGIN\_IS\_NOT\_LOADED)

Message: Plugin '%s' is not loaded

- Error: 1525 SQLSTATE: HY000 (ER\_WRONG\_VALUE)  
Message: Incorrect %s value: '%s'
- Error: 1526 SQLSTATE: HY000 (ER\_NO\_PARTITION\_FOR\_GIVEN\_VALUE)  
Message: Table has no partition for value %s
- Error: 1527 SQLSTATE: HY000 (ER\_FILEGROUP\_OPTION\_ONLY\_ONCE)  
Message: It is not allowed to specify %s more than once
- Error: 1528 SQLSTATE: HY000 (ER\_CREATE\_FILEGROUP\_FAILED)  
Message: Failed to create %s
- Error: 1529 SQLSTATE: HY000 (ER\_DROP\_FILEGROUP\_FAILED)  
Message: Failed to drop %s
- Error: 1530 SQLSTATE: HY000 (ER\_TABLESPACE\_AUTO\_EXTEND\_ERROR)  
Message: The handler doesn't support autoextend of tablespaces
- Error: 1531 SQLSTATE: HY000 (ER\_WRONG\_SIZE\_NUMBER)  
Message: A size parameter was incorrectly specified, either number or on the form 10M
- Error: 1532 SQLSTATE: HY000 (ER\_SIZE\_OVERFLOW\_ERROR)  
Message: The size number was correct but we don't allow the digit part to be more than 2 billion
- Error: 1533 SQLSTATE: HY000 (ER\_ALTER\_FILEGROUP\_FAILED)  
Message: Failed to alter: %s
- Error: 1534 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_LOGGING\_FAILED)  
Message: Writing one row to the row-based binary log failed
- Error: 1535 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_WRONG\_TABLE\_DEF)  
Message: Table definition on master and slave does not match: %s
- Error: 1536 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_RBR\_TO\_SBR)  
Message: Slave running with --log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events
- Error: 1537 SQLSTATE: HY000 (ER\_EVENT\_ALREADY\_EXISTS)  
Message: Event '%s' already exists
- Error: 1538 SQLSTATE: HY000 (ER\_EVENT\_STORE\_FAILED)  
Message: Failed to store event %s. Error code %d from storage engine.
- Error: 1539 SQLSTATE: HY000 (ER\_EVENT\_DOES\_NOT\_EXIST)  
Message: Unknown event '%s'
- Error: 1540 SQLSTATE: HY000 (ER\_EVENT\_CANT\_ALTER)  
Message: Failed to alter event '%s'

- Error: 1541 SQLSTATE: HY000 (ER\_EVENT\_DROP\_FAILED)  
Message: Failed to drop %s
- Error: 1542 SQLSTATE: HY000 (ER\_EVENT\_INTERVAL\_NOT\_POSITIVE\_OR\_TOO\_BIG)  
Message: INTERVAL is either not positive or too big
- Error: 1543 SQLSTATE: HY000 (ER\_EVENT\_ENDS\_BEFORE\_STARTS)  
Message: ENDS is either invalid or before STARTS
- Error: 1544 SQLSTATE: HY000 (ER\_EVENT\_EXEC\_TIME\_IN\_THE\_PAST)  
Message: Event execution time is in the past. Event has been disabled
- Error: 1545 SQLSTATE: HY000 (ER\_EVENT\_OPEN\_TABLE\_FAILED)  
Message: Failed to open mysql.event
- Error: 1546 SQLSTATE: HY000 (ER\_EVENT\_NEITHER\_M\_EXPR\_NOR\_M\_AT)  
Message: No datetime expression provided
- Error: 1547 SQLSTATE: HY000 (ER\_OBSOLETE\_COL\_COUNT\_DOESNT\_MATCH\_CORRUPTED)  
Message: Column count of mysql.%s is wrong. Expected %d, found %d. The table is probably corrupted
- Error: 1548 SQLSTATE: HY000 (ER\_OBSOLETE\_CANNOT\_LOAD\_FROM\_TABLE)  
Message: Cannot load from mysql.%s. The table is probably corrupted
- Error: 1549 SQLSTATE: HY000 (ER\_EVENT\_CANNOT\_DELETE)  
Message: Failed to delete the event from mysql.event
- Error: 1550 SQLSTATE: HY000 (ER\_EVENT\_COMPILE\_ERROR)  
Message: Error during compilation of event's body
- Error: 1551 SQLSTATE: HY000 (ER\_EVENT\_SAME\_NAME)  
Message: Same old and new event name
- Error: 1552 SQLSTATE: HY000 (ER\_EVENT\_DATA\_TOO\_LONG)  
Message: Data for column '%s' too long
- Error: 1553 SQLSTATE: HY000 (ER\_DROP\_INDEX\_FK)  
Message: Cannot drop index '%s': needed in a foreign key constraint

[InnoDB](#) reports this error when you attempt to drop the last index that can enforce a particular referential constraint.

For optimal performance with DML statements, [InnoDB](#) requires an index to exist on [foreign key](#) columns, so that [UPDATE](#) and [DELETE](#) operations on a [parent table](#) can easily check whether corresponding rows exist in the [child table](#). MySQL creates or drops such indexes automatically when needed, as a side-effect of [CREATE TABLE](#), [CREATE INDEX](#), and [ALTER TABLE](#) statements.

When you drop an index, [InnoDB](#) checks if the index is used for checking a foreign key constraint. It is still OK to drop the index if there is another index that can be used to enforce the same constraint. [InnoDB](#) prevents you from dropping the last index that can enforce a particular referential constraint.

- Error: 1554 SQLSTATE: HY000 (ER\_WARN\_DEPRECATED\_SYNTAX\_WITH\_VER)  
Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead
- Error: 1555 SQLSTATE: HY000 (ER\_CANT\_WRITE\_LOCK\_LOG\_TABLE)  
Message: You can't write-lock a log table. Only read access is possible
- Error: 1556 SQLSTATE: HY000 (ER\_CANT\_LOCK\_LOG\_TABLE)  
Message: You can't use locks with log tables.
- Error: 1557 SQLSTATE: 23000 (ER\_FOREIGN\_DUPLICATE\_KEY\_OLD\_UNUSED)  
Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry
- Error: 1558 SQLSTATE: HY000 (ER\_COL\_COUNT\_DOESNT\_MATCH\_PLEASE\_UPDATE)  
Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql\_upgrade to fix this error.
- Error: 1559 SQLSTATE: HY000 (ER\_TEMP\_TABLE\_PREVENTS\_SWITCH\_OUT\_OF\_RBR)  
Message: Cannot switch out of the row-based binary log format when the session has open temporary tables
- Error: 1560 SQLSTATE: HY000 (ER\_STORED\_FUNCTION\_PREVENTS\_SWITCH\_BINLOG\_FORMAT)  
Message: Cannot change the binary logging format inside a stored function or trigger
- Error: 1561 SQLSTATE: HY000 (ER\_NDB\_CANT\_SWITCH\_BINLOG\_FORMAT)  
Message: The NDB cluster engine does not support changing the binlog format on the fly yet
- Error: 1562 SQLSTATE: HY000 (ER\_PARTITION\_NO\_TEMPORARY)  
Message: Cannot create temporary table with partitions
- Error: 1563 SQLSTATE: HY000 (ER\_PARTITION\_CONST\_DOMAIN\_ERROR)  
Message: Partition constant is out of partition function domain
- Error: 1564 SQLSTATE: HY000 (ER\_PARTITION\_FUNCTION\_IS\_NOT\_ALLOWED)  
Message: This partition function is not allowed
- Error: 1565 SQLSTATE: HY000 (ER\_DDL\_LOG\_ERROR)  
Message: Error in DDL log
- Error: 1566 SQLSTATE: HY000 (ER\_NULL\_IN\_VALUES\_LESS\_THAN)  
Message: Not allowed to use NULL value in VALUES LESS THAN
- Error: 1567 SQLSTATE: HY000 (ER\_WRONG\_PARTITION\_NAME)  
Message: Incorrect partition name
- Error: 1568 SQLSTATE: 25001 (ER\_CANT\_CHANGE\_TX\_CHARACTERISTICS)  
Message: Transaction characteristics can't be changed while a transaction is in progress
- Error: 1569 SQLSTATE: HY000 (ER\_DUP\_ENTRY\_AUTOINCREMENT\_CASE)

Message: ALTER TABLE causes auto\_increment resequencing, resulting in duplicate entry '%s' for key '%s'

- Error: 1570 SQLSTATE: HY000 (ER\_EVENT\_MODIFY\_QUEUE\_ERROR)

Message: Internal scheduler error %d

- Error: 1571 SQLSTATE: HY000 (ER\_EVENT\_SET\_VAR\_ERROR)

Message: Error during starting/stopping of the scheduler. Error code %u

- Error: 1572 SQLSTATE: HY000 (ER\_PARTITION\_MERGE\_ERROR)

Message: Engine cannot be used in partitioned tables

- Error: 1573 SQLSTATE: HY000 (ER\_CANT\_ACTIVATE\_LOG)

Message: Cannot activate '%s' log

- Error: 1574 SQLSTATE: HY000 (ER\_RBR\_NOT\_AVAILABLE)

Message: The server was not built with row-based replication

- Error: 1575 SQLSTATE: HY000 (ER\_BASE64\_DECODE\_ERROR)

Message: Decoding of base64 string failed

- Error: 1576 SQLSTATE: HY000 (ER\_EVENT\_RECURSION\_FORBIDDEN)

Message: Recursion of EVENT DDL statements is forbidden when body is present

- Error: 1577 SQLSTATE: HY000 (ER\_EVENTS\_DB\_ERROR)

Message: Cannot proceed because system tables used by Event Scheduler were found damaged at server start

To address this issue, try running `mysql_upgrade`.

- Error: 1578 SQLSTATE: HY000 (ER\_ONLY\_INTEGERS\_ALLOWED)

Message: Only integers allowed as number here

- Error: 1579 SQLSTATE: HY000 (ER\_UNSUPPORTED\_LOG\_ENGINE)

Message: This storage engine cannot be used for log tables"

- Error: 1580 SQLSTATE: HY000 (ER\_BAD\_LOG\_STATEMENT)

Message: You cannot '%s' a log table if logging is enabled

- Error: 1581 SQLSTATE: HY000 (ER\_CANT\_RENAME\_LOG\_TABLE)

Message: Cannot rename '%s'. When logging enabled, rename to/from log table must rename two tables: the log table to an archive table and another table back to '%s'

- Error: 1582 SQLSTATE: 42000 (ER\_WRONG\_PARAMCOUNT\_TO\_NATIVE\_FCT)

Message: Incorrect parameter count in the call to native function '%s'

- Error: 1583 SQLSTATE: 42000 (ER\_WRONG\_PARAMETERS\_TO\_NATIVE\_FCT)

Message: Incorrect parameters in the call to native function '%s'

- Error: 1584 SQLSTATE: 42000 (ER\_WRONG\_PARAMETERS\_TO\_STORED\_FCT)

Message: Incorrect parameters in the call to stored function %s

- Error: 1585 SQLSTATE: HY000 (ER\_NATIVE\_FCT\_NAME\_COLLISION)

Message: This function '%s' has the same name as a native function

- Error: 1586 SQLSTATE: 23000 (ER\_DUP\_ENTRY\_WITH\_KEY\_NAME)

Message: Duplicate entry '%s' for key '%s'

The format string for this error is also used with ER\_DUP\_ENTRY.

- Error: 1587 SQLSTATE: HY000 (ER\_BINLOG\_PURGE\_EMFILE)

Message: Too many files opened, please execute the command again

- Error: 1588 SQLSTATE: HY000 (ER\_EVENT\_CANNOT\_CREATE\_IN\_THE\_PAST)

Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immediately after creation.

- Error: 1589 SQLSTATE: HY000 (ER\_EVENT\_CANNOT\_ALTER\_IN\_THE\_PAST)

Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was not changed. Specify a time in the future.

- Error: 1590 SQLSTATE: HY000 (ER\_SLAVE\_INCIDENT)

Message: The incident %s occurred on the master. Message: %s

- Error: 1591 SQLSTATE: HY000 (ER\_NO\_PARTITION\_FOR\_GIVEN\_VALUE\_SILENT)

Message: Table has no partition for some existing values

- Error: 1592 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_STATEMENT)

Message: Unsafe statement written to the binary log using statement format since BINLOG\_FORMAT = STATEMENT. %s

- Error: 1593 SQLSTATE: HY000 (ER\_SLAVE\_FATAL\_ERROR)

Message: Fatal error: %s

- Error: 1594 SQLSTATE: HY000 (ER\_SLAVE\_RELAY\_LOG\_READ\_FAILURE)

Message: Relay log read failure: %s

- Error: 1595 SQLSTATE: HY000 (ER\_SLAVE\_RELAY\_LOG\_WRITE\_FAILURE)

Message: Relay log write failure: %s

- Error: 1596 SQLSTATE: HY000 (ER\_SLAVE\_CREATE\_EVENT\_FAILURE)

Message: Failed to create %s

- Error: 1597 SQLSTATE: HY000 (ER\_SLAVE\_MASTER\_COM\_FAILURE)

Message: Master command %s failed: %s

- Error: 1598 SQLSTATE: HY000 (ER\_BINLOG\_LOGGING\_IMPOSSIBLE)

Message: Binary logging not possible. Message: %s

- Error: 1599 SQLSTATE: HY000 (ER\_VIEW\_NO\_CREATION\_CTX)

Message: View ``%s`.`%s` has no creation context

- Error: 1600 SQLSTATE: HY000 (ER\_VIEW\_INVALID\_CREATION\_CTX)

Message: Creation context of view ``%s`.`%s` is invalid

- Error: 1601 SQLSTATE: HY000 (ER\_SR\_INVALID\_CREATION\_CTX)

Message: Creation context of stored routine ``%s`.`%s` is invalid

- Error: 1602 SQLSTATE: HY000 (ER\_TRG\_CORRUPTED\_FILE)

Message: Corrupted TRG file for table ``%s`.`%s`

- Error: 1603 SQLSTATE: HY000 (ER\_TRG\_NO\_CREATION\_CTX)

Message: Triggers for table ``%s`.`%s` have no creation context

- Error: 1604 SQLSTATE: HY000 (ER\_TRG\_INVALID\_CREATION\_CTX)

Message: Trigger creation context of table ``%s`.`%s` is invalid

- Error: 1605 SQLSTATE: HY000 (ER\_EVENT\_INVALID\_CREATION\_CTX)

Message: Creation context of event ``%s`.`%s` is invalid

- Error: 1606 SQLSTATE: HY000 (ER\_TRG\_CANT\_OPEN\_TABLE)

Message: Cannot open table for trigger ``%s`.`%s`

- Error: 1607 SQLSTATE: HY000 (ER\_CANT\_CREATE\_SROUTINE)

Message: Cannot create stored routine ``%s`. Check warnings

- Error: 1608 SQLSTATE: HY000 (ER\_NEVER\_USED)

Message: Ambiguous slave modes combination. %s

- Error: 1609 SQLSTATE: HY000  
(ER\_NO\_FORMAT\_DESCRIPTION\_EVENT\_BEFORE\_BINLOG\_STATEMENT)

Message: The BINLOG statement of type ``%s` was not preceded by a format description BINLOG statement.

- Error: 1610 SQLSTATE: HY000 (ER\_SLAVE\_CORRUPT\_EVENT)

Message: Corrupted replication event was detected

- Error: 1611 SQLSTATE: HY000 (ER\_LOAD\_DATA\_INVALID\_COLUMN)

Message: Invalid column reference (%s) in LOAD DATA

ER\_LOAD\_DATA\_INVALID\_COLUMN was removed after 5.7.7.

- Error: 1611 SQLSTATE: HY000 (ER\_LOAD\_DATA\_INVALID\_COLUMN\_UNUSED)

Message: Invalid column reference (%s) in LOAD DATA

ER\_LOAD\_DATA\_INVALID\_COLUMN\_UNUSED was added in 5.7.8.

- Error: 1612 SQLSTATE: HY000 (ER\_LOG\_PURGE\_NO\_FILE)

Message: Being purged log %s was not found

- Error: 1613 SQLSTATE: XA106 (ER\_XA\_RBTIMEOUT)  
Message: XA\_RBTIMEOUT: Transaction branch was rolled back: took too long

Message: Inconsistency in usage of column lists for partitioning
- Error: 1654 SQLSTATE: HY000 (ER\_WRONG\_TYPE\_COLUMN\_VALUE\_ERROR)  
Message: Partition column values of incorrect type
- Error: 1655 SQLSTATE: HY000 (ER\_TOO\_MANY\_PARTITION\_FUNC\_FIELDS\_ERROR)  
Message: Too many fields in '%s'
- Error: 1656 SQLSTATE: HY000 (ER\_MAXVALUE\_IN\_VALUES\_IN)  
Message: Cannot use MAXVALUE as value in VALUES IN
- Error: 1657 SQLSTATE: HY000 (ER\_TOO\_MANY\_VALUES\_ERROR)  
Message: Cannot have more than one value for this type of %s partitioning
- Error: 1658 SQLSTATE: HY000 (ER\_ROW\_SINGLE\_PARTITION\_FIELD\_ERROR)  
Message: Row expressions in VALUES IN only allowed for multi-field column partitioning

- Error: 1659 SQLSTATE: HY000 (ER\_FIELD\_TYPE\_NOT\_ALLOWED\_AS\_PARTITION\_FIELD)

Message: Field '%s' is of a not allowed type for this type of partitioning
- Error: 1660 SQLSTATE: HY000 (ER\_PARTITION\_FIELDS\_TOO\_LONG)

Message: The total length of the partitioning fields is too large
- Error: 1661 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_ENGINE\_AND\_STMT\_ENGINE)

Message: Cannot execute statement: impossible to write to binary log since both row-incapable engines and statement-incapable engines are involved.
- Error: 1662 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_MODE\_AND\_STMT\_ENGINE)

Message: Cannot execute statement: impossible to write to binary log since BINLOG\_FORMAT = ROW and at least one table uses a storage engine limited to statement-based logging.
- Error: 1663 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_AND\_STMT\_ENGINE)

Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage engine is limited to statement-based logging, and BINLOG\_FORMAT = MIXED. %s
- Error: 1664 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_INJECTION\_AND\_STMT\_ENGINE)

Message: Cannot execute statement: impossible to write to binary log since statement is in row format and at least one table uses a storage engine limited to statement-based logging.
- Error: 1665 SQLSTATE: HY000 (ER\_BINLOG\_STMT\_MODE\_AND\_ROW\_ENGINE)

Message: Cannot execute statement: impossible to write to binary log since BINLOG\_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.%s
- Error: 1666 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_INJECTION\_AND\_STMT\_MODE)

Message: Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG\_FORMAT = STATEMENT.
- Error: 1667 SQLSTATE: HY000  
(ER\_BINLOG\_MULTIPLE\_ENGINES\_AND\_SELF\_LOGGING\_ENGINE)

Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.
- Error: 1668 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_LIMIT)

Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.
- Error: 1669 SQLSTATE: HY000 (ER\_UNUSED4)

Message: The statement is unsafe because it uses INSERT DELAYED. This is unsafe because the times when rows are inserted cannot be predicted.
- Error: 1670 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_SYSTEM\_TABLE)

Message: The statement is unsafe because it uses the general log, slow query log, or performance\_schema table(s). This is unsafe because system tables may differ on slaves.
- Error: 1671 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_AUTOINC\_COLUMNS)

Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO\_INCREMENT column. Inserted values cannot be logged correctly.

- Error: 1672 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_UDF)  
Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.
- Error: 1673 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_SYSTEM\_VARIABLE)  
Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.
- Error: 1674 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_SYSTEM\_FUNCTION)  
Message: Statement is unsafe because it uses a system function that may return a different value on the slave.
- Error: 1675 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_NONTRANS\_AFTER\_TRANS)  
Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.
- Error: 1676 SQLSTATE: HY000 (ER\_MESSAGE\_AND\_STATEMENT)  
Message: %s Statement: %s
- Error: 1677 SQLSTATE: HY000 (ER\_SLAVE\_CONVERSION\_FAILED)  
Message: Column %d of table '%s.%s' cannot be converted from type '%s' to type '%s'
- Error: 1678 SQLSTATE: HY000 (ER\_SLAVE\_CANT\_CREATE\_CONVERSION)  
Message: Can't create conversion table for table '%s.%s'
- Error: 1679 SQLSTATE: HY000  
(ER\_INSIDE\_TRANSACTION\_PREVENTS\_SWITCH\_BINLOG\_FORMAT)  
Message: Cannot modify @@session.binlog\_format inside a transaction
- Error: 1680 SQLSTATE: HY000 (ER\_PATH\_LENGTH)  
Message: The path specified for %s is too long.
- Error: 1681 SQLSTATE: HY000 (ER\_WARN\_DEPRECATED\_SYNTAX\_NO\_REPLACEMENT)  
Message: '%s' is deprecated and will be removed in a future release.
- Error: 1682 SQLSTATE: HY000 (ER\_WRONG\_NATIVE\_TABLE\_STRUCTURE)  
Message: Native table '%s'.'%s' has the wrong structure
- Error: 1683 SQLSTATE: HY000 (ER\_WRONG\_PERFSCHEMA\_USAGE)  
Message: Invalid performance\_schema usage.
- Error: 1684 SQLSTATE: HY000 (ER\_WARN\_I\_S\_SKIPPED\_TABLE)  
Message: Table '%s'.'%s' was skipped since its definition is being modified by concurrent DDL statement
- Error: 1685 SQLSTATE: HY000  
(ER\_INSIDE\_TRANSACTION\_PREVENTS\_SWITCH\_BINLOG\_DIRECT)  
Message: Cannot modify @@session.binlog\_direct\_non\_transactional\_updates inside a transaction
- Error: 1686 SQLSTATE: HY000 (ER\_STORED\_FUNCTION\_PREVENTS\_SWITCH\_BINLOG\_DIRECT)

Message: Cannot change the binlog direct flag inside a stored function or trigger

- Error: 1687 SQLSTATE: 42000 (ER\_SPATIAL\_MUST\_HAVE\_GEOM\_COL)

Message: A SPATIAL index may only contain a geometrical type column

- Error: 1688 SQLSTATE: HY000 (ER\_TOO\_LONG\_INDEX\_COMMENT)

Message: Comment for index '%s' is too long (max = %lu)

- Error: 1689 SQLSTATE: HY000 (ER\_LOCK\_ABORTED)

Message: Wait on a lock was aborted due to a pending exclusive lock

- Error: 1690 SQLSTATE: 22003 (ER\_DATA\_OUT\_OF\_RANGE)

Message: %s value is out of range in '%s'

- Error: 1691 SQLSTATE: HY000 (ER\_WRONG\_SPVAR\_TYPE\_IN\_LIMIT)

Message: A variable of a non-integer based type in LIMIT clause

- Error: 1692 SQLSTATE: HY000  
(ER\_BINLOG\_UNSAFE\_MULTIPLE\_ENGINES\_AND\_SELF\_LOGGING\_ENGINE)

Message: Mixing self-logging and non-self-logging engines in a statement is unsafe.

- Error: 1693 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_MIXED\_STATEMENT)

Message: Statement accesses nontransactional table as well as transactional or temporary table, and writes to any of them.

- Error: 1694 SQLSTATE: HY000  
(ER\_INSIDE\_TRANSACTION\_PREVENTS\_SWITCH\_SQL\_LOG\_BIN)

Message: Cannot modify @@session.sql\_log\_bin inside a transaction

- Error: 1695 SQLSTATE: HY000 (ER\_STORED\_FUNCTION\_PREVENTS\_SWITCH\_SQL\_LOG\_BIN)

Message: Cannot change the sql\_log\_bin inside a stored function or trigger

- Error: 1696 SQLSTATE: HY000 (ER\_FAILED\_READ\_FROM\_PAR\_FILE)

Message: Failed to read from the .par file

- Error: 1697 SQLSTATE: HY000 (ER\_VALUES\_IS\_NOT\_INT\_TYPE\_ERROR)

Message: VALUES value for partition '%s' must have type INT

- Error: 1698 SQLSTATE: 28000 (ER\_ACCESS\_DENIED\_NO\_PASSWORD\_ERROR)

Message: Access denied for user '%s'@'%s'

- Error: 1699 SQLSTATE: HY000 (ER\_SET\_PASSWORD\_AUTH\_PLUGIN)

Message: SET PASSWORD has no significance for users authenticating via plugins

- Error: 1700 SQLSTATE: HY000 (ER\_GRANT\_PLUGIN\_USER\_EXISTS)

Message: GRANT with IDENTIFIED WITH is illegal because the user %-.\*s already exists

- Error: 1701 SQLSTATE: 42000 (ER\_TRUNCATE\_ILLEGAL\_FK)

Message: Cannot truncate a table referenced in a foreign key constraint (%s)

- Error: [1702](#) SQLSTATE: [HY000](#) ([ER\\_PLUGIN\\_IS\\_PERMANENT](#))  
Message: Plugin '%s' is force\_plus\_permanent and can not be unloaded
- Error: [1703](#) SQLSTATE: [HY000](#) ([ER\\_SLAVE\\_HEARTBEAT\\_VALUE\\_OUT\\_OF\\_RANGE\\_MIN](#))  
Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeating will effectively be disabled.
- Error: [1704](#) SQLSTATE: [HY000](#) ([ER\\_SLAVE\\_HEARTBEAT\\_VALUE\\_OUT\\_OF\\_RANGE\\_MAX](#))  
Message: The requested value for the heartbeat period exceeds the value of `slave\_net\_timeout` seconds. A sensible value for the period should be less than the timeout.
- Error: [1705](#) SQLSTATE: [HY000](#) ([ER\\_STMT\\_CACHE\\_FULL](#))  
Message: Multi-row statements required more than 'max\_binlog\_stmt\_cache\_size' bytes of storage; increase this mysqld variable and try again
- Error: [1706](#) SQLSTATE: [HY000](#) ([ER\\_MULTI\\_UPDATE\\_KEY\\_CONFLICT](#))  
Message: Primary key/partition key update is not allowed since the table is updated both as '%s' and '%s'.
- Error: [1707](#) SQLSTATE: [HY000](#) ([ER\\_TABLE\\_NEEDS\\_REBUILD](#))  
Message: Table rebuild required. Please do "ALTER TABLE ` %s ` FORCE" or dump/reload to fix it!
- Error: [1708](#) SQLSTATE: [HY000](#) ([WARN\\_OPTION\\_BELOW\\_LIMIT](#))  
Message: The value of '%s' should be no less than the value of '%s'
- Error: [1709](#) SQLSTATE: [HY000](#) ([ER\\_INDEX\\_COLUMN\\_TOO\\_LONG](#))  
Message: Index column size too large. The maximum column size is %lu bytes.
- Error: [1710](#) SQLSTATE: [HY000](#) ([ER\\_ERROR\\_IN\\_TRIGGER\\_BODY](#))  
Message: Trigger '%s' has an error in its body: '%s'
- Error: [1711](#) SQLSTATE: [HY000](#) ([ER\\_ERROR\\_IN\\_UNKNOWN\\_TRIGGER\\_BODY](#))  
Message: Unknown trigger has an error in its body: '%s'
- Error: [1712](#) SQLSTATE: [HY000](#) ([ER\\_INDEX\\_CORRUPT](#))  
Message: Index %s is corrupted
- Error: [1713](#) SQLSTATE: [HY000](#) ([ER\\_UNDO\\_RECORD\\_TOO\\_BIG](#))  
Message: Undo log record is too big.
- Error: [1714](#) SQLSTATE: [HY000](#) ([ER\\_BINLOG\\_UNSAFE\\_INSERT\\_IGNORE\\_SELECT](#))  
Message: INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.
- Error: [1715](#) SQLSTATE: [HY000](#) ([ER\\_BINLOG\\_UNSAFE\\_INSERT\\_SELECT\\_UPDATE](#))  
Message: INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.
- Error: [1716](#) SQLSTATE: [HY000](#) ([ER\\_BINLOG\\_UNSAFE\\_REPLACE\\_SELECT](#))

Message: REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1717 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_CREATE\_IGNORE\_SELECT)

Message: CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1718 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_CREATE\_REPLACE\_SELECT)

Message: CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1719 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_UPDATE\_IGNORE)

Message: UPDATE IGNORE is unsafe because the order in which rows are updated determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1720 SQLSTATE: HY000 (ER\_PLUGIN\_NO\_UNINSTALL)

Message: Plugin '%s' is marked as not dynamically uninstallable. You have to stop the server to uninstall it.

- Error: 1721 SQLSTATE: HY000 (ER\_PLUGIN\_NO\_INSTALL)

Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

- Error: 1722 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_WRITE\_AUTOINC\_SELECT)

Message: Statements writing to a table with an auto-increment column after selecting from another table are unsafe because the order in which rows are retrieved determines what (if any) rows will be written. This order cannot be predicted and may differ on master and the slave.

- Error: 1723 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_CREATE\_SELECT\_AUTOINC)

Message: CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This order cannot be predicted and may differ on master and the slave.

- Error: 1724 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_INSERT\_TWO\_KEYS)

Message: INSERT... ON DUPLICATE KEY UPDATE on a table with more than one UNIQUE KEY is unsafe

- Error: 1725 SQLSTATE: HY000 (ER\_TABLE\_IN\_FK\_CHECK)

Message: Table is being used in foreign key check.

- Error: 1726 SQLSTATE: HY000 (ER\_UNSUPPORTED\_ENGINE)

Message: Storage engine '%s' does not support system tables. [%s.%s]

- Error: 1727 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_AUTOINC\_NOT\_FIRST)

Message: INSERT into autoincrement field which is not the first part in the composed primary key is unsafe.

- Error: 1728 SQLSTATE: HY000 (ER\_CANNOT\_LOAD\_FROM\_TABLE\_V2)

Message: Cannot load from %s.%s. The table is probably corrupted

- Error: 1729 SQLSTATE: HY000 (ER\_MASTER\_DELAY\_VALUE\_OUT\_OF\_RANGE)

Message: The requested value %s for the master delay exceeds the maximum %u

- Error: 1730 SQLSTATE: HY000  
(ER\_ONLY\_FD\_AND\_RBR\_EVENTS\_ALLOWED\_IN\_BINLOG\_STATEMENT)

Message: Only Format\_description\_log\_event and row events are allowed in BINLOG statements (but %s was provided)

- Error: 1731 SQLSTATE: HY000 (ER\_PARTITION\_EXCHANGE\_DIFFERENT\_OPTION)

Message: Non matching attribute '%s' between partition and table

- Error: 1732 SQLSTATE: HY000 (ER\_PARTITION\_EXCHANGE\_PART\_TABLE)

Message: Table to exchange with partition is partitioned: '%s'

- Error: 1733 SQLSTATE: HY000 (ER\_PARTITION\_EXCHANGE\_TEMP\_TABLE)

Message: Table to exchange with partition is temporary: '%s'

- Error: 1734 SQLSTATE: HY000 (ER\_PARTITION\_INSTEAD\_OF\_SUBPARTITION)

Message: Subpartitioned table, use subpartition instead of partition

- Error: 1735 SQLSTATE: HY000 (ER\_UNKNOWN\_PARTITION)

Message: Unknown partition '%s' in table '%s'

- Error: 1736 SQLSTATE: HY000 (ER\_TABLES\_DIFFERENT\_METADATA)

Message: Tables have different definitions

- Error: 1737 SQLSTATE: HY000 (ER\_ROW\_DOES\_NOT\_MATCH\_PARTITION)

Message: Found a row that does not match the partition

- Error: 1738 SQLSTATE: HY000 (ER\_BINLOG\_CACHE\_SIZE\_GREATER\_THAN\_MAX)

Message: Option binlog\_cache\_size (%lu) is greater than max\_binlog\_cache\_size (%lu); setting binlog\_cache\_size equal to max\_binlog\_cache\_size.

- Error: 1739 SQLSTATE: HY000 (ER\_WARN\_INDEX\_NOT\_APPLICABLE)

Message: Cannot use %s access on index '%s' due to type or collation conversion on field '%s'

- Error: 1740 SQLSTATE: HY000 (ER\_PARTITION\_EXCHANGE\_FOREIGN\_KEY)

Message: Table to exchange with partition has foreign key references: '%s'

- Error: 1741 SQLSTATE: HY000 (ER\_NO\_SUCH\_KEY\_VALUE)

Message: Key value '%s' was not found in table '%s.%s'

- Error: 1742 SQLSTATE: HY000 (ER\_RPL\_INFO\_DATA\_TOO\_LONG)

Message: Data for column '%s' too long

- Error: 1743 SQLSTATE: HY000 (ER\_NETWORK\_READ\_EVENT\_CHECKSUM\_FAILURE)

Message: Replication event checksum verification failed while reading from network.

- Error: 1744 SQLSTATE: HY000 (ER\_BINLOG\_READ\_EVENT\_CHECKSUM\_FAILURE)  
Message: Replication event checksum verification failed while reading from a log file.
- Error: 1745 SQLSTATE: HY000 (ER\_BINLOG\_STMT\_CACHE\_SIZE\_GREATER\_THAN\_MAX)  
Message: Option binlog\_stmt\_cache\_size (%lu) is greater than max\_binlog\_stmt\_cache\_size (%lu); setting binlog\_stmt\_cache\_size equal to max\_binlog\_stmt\_cache\_size.
- Error: 1746 SQLSTATE: HY000 (ER\_CANT\_UPDATE\_TABLE\_IN\_CREATE\_TABLE\_SELECT)  
Message: Can't update table '%s' while '%s' is being created.
- Error: 1747 SQLSTATE: HY000 (ER\_PARTITION\_CLAUSE\_ON\_NONPARTITIONED)  
Message: PARTITION () clause on non partitioned table
- Error: 1748 SQLSTATE: HY000 (ER\_ROW\_DOES\_NOT\_MATCH\_GIVEN\_PARTITION\_SET)  
Message: Found a row not matching the given partition set
- Error: 1749 SQLSTATE: HY000 (ER\_NO\_SUCH\_PARTITION\_\_UNUSED)  
Message: partition '%s' doesn't exist
- Error: 1750 SQLSTATE: HY000 (ER\_CHANGE\_RPL\_INFO\_REPOSITORY\_FAILURE)  
Message: Failure while changing the type of replication repository: %s.
- Error: 1751 SQLSTATE: HY000  
(ER\_WARNING\_NOT\_COMPLETE\_ROLLBACK\_WITH\_CREATED\_TEMP\_TABLE)  
Message: The creation of some temporary tables could not be rolled back.
- Error: 1752 SQLSTATE: HY000  
(ER\_WARNING\_NOT\_COMPLETE\_ROLLBACK\_WITH\_DROPPED\_TEMP\_TABLE)  
Message: Some temporary tables were dropped, but these operations could not be rolled back.
- Error: 1753 SQLSTATE: HY000 (ER\_MTS\_FEATURE\_IS\_NOT\_SUPPORTED)  
Message: %s is not supported in multi-threaded slave mode. %s
- Error: 1754 SQLSTATE: HY000 (ER\_MTS\_UPDATED\_DBS\_GREATER\_MAX)  
Message: The number of modified databases exceeds the maximum %d; the database names will not be included in the replication event metadata.
- Error: 1755 SQLSTATE: HY000 (ER\_MTS\_CANT\_PARALLEL)  
Message: Cannot execute the current event group in the parallel mode. Encountered event %s, relay-log name %s, position %s which prevents execution of this event group in parallel mode. Reason: %s.
- Error: 1756 SQLSTATE: HY000 (ER\_MTS\_INCONSISTENT\_DATA)  
Message: %s
- Error: 1757 SQLSTATE: HY000 (ER\_FULLTEXT\_NOT\_SUPPORTED\_WITH\_PARTITIONING)  
Message: FULLTEXT index is not supported for partitioned tables.
- Error: 1758 SQLSTATE: 35000 (ER\_DA\_INVALID\_CONDITION\_NUMBER)  
Message: Invalid condition number

- Error: 1759 SQLSTATE: HY000 (ER\_INSECURE\_PLAIN\_TEXT)

Message: Sending passwords in plain text without SSL/TLS is extremely insecure.

- Error: 1760 SQLSTATE: HY000 (ER\_INSECURE\_CHANGE\_MASTER)

Message: Storing MySQL user name or password information in the master info repository is not secure and is therefore not recommended. Please consider using the USER and PASSWORD connection options for START SLAVE; see the 'START SLAVE Syntax' in the MySQL Manual for more information.

- Error: 1761 SQLSTATE: 23000 (ER\_FOREIGN\_DUPLICATE\_KEY\_WITH\_CHILD\_INFO)

Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in table '%s', key '%s'

- Error: 1762 SQLSTATE: 23000 (ER\_FOREIGN\_DUPLICATE\_KEY\_WITHOUT\_CHILD\_INFO)

Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in a child table

- Error: 1763 SQLSTATE: HY000 (ER\_SQLTHREAD\_WITH\_SECURE\_SLAVE)

Message: Setting authentication options is not possible when only the Slave SQL Thread is being started.

- Error: 1764 SQLSTATE: HY000 (ER\_TABLE\_HAS\_NO\_FT)

Message: The table does not have FULLTEXT index to support this query

- Error: 1765 SQLSTATE: HY000 (ER\_VARIABLE\_NOT\_SETTABLE\_IN\_SF\_OR\_TRIGGER)

Message: The system variable %s cannot be set in stored functions or triggers.

- Error: 1766 SQLSTATE: HY000 (ER\_VARIABLE\_NOT\_SETTABLE\_IN\_TRANSACTION)

Message: The system variable %s cannot be set when there is an ongoing transaction.

- Error: 1767 SQLSTATE: HY000 (ER\_GTID\_NEXT\_IS\_NOT\_IN\_GTID\_NEXT\_LIST)

Message: The system variable @@SESSION.GTID\_NEXT has the value %s, which is not listed in @@SESSION.GTID\_NEXT\_LIST.

- Error: 1768 SQLSTATE: HY000  
(ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION\_WHEN\_GTID\_NEXT\_LIST\_IS\_NULL)

Message: The system variable @@SESSION.GTID\_NEXT cannot change inside a transaction.

ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION\_WHEN\_GTID\_NEXT\_LIST\_IS\_NULL was removed after 5.7.5.

- Error: 1768 SQLSTATE: HY000 (ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION)

Message: The system variable @@SESSION.GTID\_NEXT cannot change inside a transaction.

ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION was added in 5.7.6.

- Error: 1769 SQLSTATE: HY000 (ER\_SET\_STATEMENT\_CANNOT\_INVOKE\_FUNCTION)

Message: The statement 'SET %s' cannot invoke a stored function.

- Error: 1770 SQLSTATE: HY000  
(ER\_GTID\_NEXT\_CANT\_BE\_AUTOMATIC\_IF\_GTID\_NEXT\_LIST\_IS\_NON\_NULL)

Message: The system variable @@SESSION.GTID\_NEXT cannot be 'AUTOMATIC' when @@SESSION.GTID\_NEXT\_LIST is non-NULL.

- Error: 1771 SQLSTATE: HY000 (ER\_SKIPPING\_LOGGED\_TRANSACTION)

Message: Skipping transaction %s because it has already been executed and logged.

- Error: 1772 SQLSTATE: HY000 (ER\_MALFORMED\_GTID\_SET\_SPECIFICATION)

Message: Malformed GTID set specification '%s'.

- Error: 1773 SQLSTATE: HY000 (ER\_MALFORMED\_GTID\_SET\_ENCODING)

Message: Malformed GTID set encoding.

- Error: 1774 SQLSTATE: HY000 (ER\_MALFORMED\_GTID\_SPECIFICATION)

Message: Malformed GTID specification '%s'.

- Error: 1775 SQLSTATE: HY000 (ER\_GNO\_EXHAUSTED)

Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the server with a new server\_uuid.

- Error: 1776 SQLSTATE: HY000 (ER\_BAD\_SLAVE\_AUTO\_POSITION)

Message: Parameters MASTER\_LOG\_FILE, MASTER\_LOG\_POS, RELAY\_LOG\_FILE and RELAY\_LOG\_POS cannot be set when MASTER\_AUTO\_POSITION is active.

- Error: 1777 SQLSTATE: HY000 (ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_ON)

Message: CHANGE MASTER TO MASTER\_AUTO\_POSITION = 1 can only be executed when @@GLOBAL.GTID\_MODE = ON.

ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_ON was removed after 5.7.5.

- Error: 1777 SQLSTATE: HY000 (ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_NOT\_OFF)

Message: CHANGE MASTER TO MASTER\_AUTO\_POSITION = 1 cannot be executed because @@GLOBAL.GTID\_MODE = OFF.

ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_NOT\_OFF was added in 5.7.6.

- Error: 1778 SQLSTATE: HY000 (ER\_CANT\_DO\_IMPLICIT\_COMMIT\_IN\_TRX\_WHEN\_GTID\_NEXT\_IS\_SET)

Message: Cannot execute statements with implicit commit inside a transaction when @@SESSION.GTID\_NEXT == 'UUID:NUMBER'.

- Error: 1779 SQLSTATE: HY000 (ER\_GTID\_MODE\_2\_OR\_3\_REQUIRES\_ENFORCE\_GTID\_CONSISTENCY\_ON)

Message: @@GLOBAL.GTID\_MODE = ON or UPGRADE\_STEP\_2 requires @@GLOBAL.ENFORCE\_GTID\_CONSISTENCY = 1.

ER\_GTID\_MODE\_2\_OR\_3\_REQUIRES\_ENFORCE\_GTID\_CONSISTENCY\_ON was removed after 5.7.5.

- Error: 1779 SQLSTATE: HY000 (ER\_GTID\_MODE\_ON\_REQUIRES\_ENFORCE\_GTID\_CONSISTENCY\_ON)

Message: GTID\_MODE = ON requires ENFORCE\_GTID\_CONSISTENCY = ON.

`ER_GTID_MODE_ON_REQUIRES_ENFORCE_GTID_CONSISTENCY_ON` was added in 5.7.6.

- Error: 1780 SQLSTATE: HY000 (`ER_GTID_MODE_REQUIRES_BINLOG`)  
 Message: @@GLOBAL.GTID\_MODE = ON or ON\_PERMISSIVE or OFF\_PERMISSIVE requires --log-bin and --log-slave-updates.

Message: Comment for table partition '%s' is too long (max = %lu)
- Error: 1794 SQLSTATE: HY000 (ER\_SLAVE\_CONFIGURATION)  
Message: Slave is not configured or failed to initialize properly. You must at least set --server-id to enable either a master or a slave. Additional error messages can be found in the MySQL error log.
- Error: 1795 SQLSTATE: HY000 (ER\_INNO\_DB\_FT\_LIMIT)  
Message: InnoDB presently supports one FULLTEXT index creation at a time
- Error: 1796 SQLSTATE: HY000 (ER\_INNO\_DB\_NO\_FT\_TEMP\_TABLE)  
Message: Cannot create FULLTEXT index on temporary InnoDB table
- Error: 1797 SQLSTATE: HY000 (ER\_INNO\_DB\_FT\_WRONG\_DOCID\_COLUMN)  
Message: Column '%s' is of wrong type for an InnoDB FULLTEXT index
- Error: 1798 SQLSTATE: HY000 (ER\_INNO\_DB\_FT\_WRONG\_DOCID\_INDEX)  
Message: Index '%s' is of wrong type for an InnoDB FULLTEXT index
- Error: 1799 SQLSTATE: HY000 (ER\_INNO\_DB\_ONLINE\_LOG\_TOO\_BIG)  
Message: Creating index '%s' required more than 'innodb\_online\_alter\_log\_max\_size' bytes of modification log. Please try again.
- Error: 1800 SQLSTATE: HY000 (ER\_UNKNOWN\_ALTER\_ALGORITHM)  
Message: Unknown ALGORITHM '%s'
- Error: 1801 SQLSTATE: HY000 (ER\_UNKNOWN\_ALTER\_LOCK)  
Message: Unknown LOCK type '%s'
- Error: 1802 SQLSTATE: HY000 (ER\_MTS\_CHANGE\_MASTER\_CANT\_RUN\_WITH\_GAPS)  
Message: CHANGE MASTER cannot be executed when the slave was stopped with an error or killed in MTS mode. Consider using RESET SLAVE or START SLAVE UNTIL.
- Error: 1803 SQLSTATE: HY000 (ER\_MTS\_RECOVERY\_FAILURE)  
Message: Cannot recover after SLAVE errored out in parallel execution mode. Additional error messages can be found in the MySQL error log.

- Error: 1804 SQLSTATE: HY000 (ER\_MTS\_RESET\_WORKERS)  
Message: Cannot clean up worker info tables. Additional error messages can be found in the MySQL error log.
- Error: 1805 SQLSTATE: HY000 (ER\_COL\_COUNT\_DOESNT\_MATCH\_CORRUPTED\_V2)  
Message: Column count of %s.%s is wrong. Expected %d, found %d. The table is probably corrupted
- Error: 1806 SQLSTATE: HY000 (ER\_SLAVE\_SILENT\_RETRY\_TRANSACTION)  
Message: Slave must silently retry current transaction
- Error: 1807 SQLSTATE: HY000 (ER\_DISCARD\_FK\_CHECKS\_RUNNING)  
Message: There is a foreign key check running on table '%s'. Cannot discard the table.
- Error: 1808 SQLSTATE: HY000 (ER\_TABLE\_SCHEMA\_MISMATCH)  
Message: Schema mismatch (%s)
- Error: 1809 SQLSTATE: HY000 (ER\_TABLE\_IN\_SYSTEM\_TABLESPACE)  
Message: Table '%s' in system tablespace
- Error: 1810 SQLSTATE: HY000 (ER\_IO\_READ\_ERROR)  
Message: IO Read error: (%lu, %s) %s
- Error: 1811 SQLSTATE: HY000 (ER\_IO\_WRITE\_ERROR)  
Message: IO Write error: (%lu, %s) %s
- Error: 1812 SQLSTATE: HY000 (ER\_TABLESPACE\_MISSING)  
Message: Tablespace is missing for table %s.
- Error: 1813 SQLSTATE: HY000 (ER\_TABLESPACE\_EXISTS)  
Message: Tablespace '%s' exists.
- Error: 1814 SQLSTATE: HY000 (ER\_TABLESPACE\_DISCARDED)  
Message: Tablespace has been discarded for table '%s'
- Error: 1815 SQLSTATE: HY000 (ER\_INTERNAL\_ERROR)  
Message: Internal error: %s
- Error: 1816 SQLSTATE: HY000 (ER\_INNODB\_IMPORT\_ERROR)  
Message: ALTER TABLE %s IMPORT TABLESPACE failed with error %lu : '%s'
- Error: 1817 SQLSTATE: HY000 (ER\_INNODB\_INDEX\_CORRUPT)  
Message: Index corrupt: %s
- Error: 1818 SQLSTATE: HY000 (ER\_INVALID\_YEAR\_COLUMN\_LENGTH)  
Message: Supports only YEAR or YEAR(4) column.
- Error: 1819 SQLSTATE: HY000 (ER\_NOT\_VALID\_PASSWORD)  
Message: Your password does not satisfy the current policy requirements

- Error: 1820 SQLSTATE: HY000 (ER\_MUST\_CHANGE\_PASSWORD)  
Message: You must reset your password using ALTER USER statement before executing this statement.
- Error: 1821 SQLSTATE: HY000 (ER\_FK\_NO\_INDEX\_CHILD)  
Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the foreign table '%s'
- Error: 1822 SQLSTATE: HY000 (ER\_FK\_NO\_INDEX\_PARENT)  
Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the referenced table '%s'
- Error: 1823 SQLSTATE: HY000 (ER\_FK\_FAIL\_ADD\_SYSTEM)  
Message: Failed to add the foreign key constraint '%s' to system tables
- Error: 1824 SQLSTATE: HY000 (ER\_FK\_CANNOT\_OPEN\_PARENT)  
Message: Failed to open the referenced table '%s'
- Error: 1825 SQLSTATE: HY000 (ER\_FK\_INCORRECT\_OPTION)  
Message: Failed to add the foreign key constraint on table '%s'. Incorrect options in FOREIGN KEY constraint '%s'
- Error: 1826 SQLSTATE: HY000 (ER\_FK\_DUP\_NAME)  
Message: Duplicate foreign key constraint name '%s'
- Error: 1827 SQLSTATE: HY000 (ER\_PASSWORD\_FORMAT)  
Message: The password hash doesn't have the expected format. Check if the correct password algorithm is being used with the PASSWORD() function.
- Error: 1828 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_DROP)  
Message: Cannot drop column '%s': needed in a foreign key constraint '%s'
- Error: 1829 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_DROP\_CHILD)  
Message: Cannot drop column '%s': needed in a foreign key constraint '%s' of table '%s'
- Error: 1830 SQLSTATE: HY000 (ER\_FK\_COLUMN\_NOT\_NULL)  
Message: Column '%s' cannot be NOT NULL: needed in a foreign key constraint '%s' SET NULL
- Error: 1831 SQLSTATE: HY000 (ER\_DUP\_INDEX)  
Message: Duplicate index '%s' defined on the table '%s.%s'. This is deprecated and will be disallowed in a future release.
- Error: 1832 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_CHANGE)  
Message: Cannot change column '%s': used in a foreign key constraint '%s'
- Error: 1833 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_CHANGE\_CHILD)  
Message: Cannot change column '%s': used in a foreign key constraint '%s' of table '%s'
- Error: 1834 SQLSTATE: HY000 (ER\_FK\_CANNOT\_DELETE\_PARENT)  
Message: Cannot delete rows from table which is parent in a foreign key constraint '%s' of table '%s'

[ER\\_FK\\_CANNOT\\_DELETE\\_PARENT](#) was removed after 5.7.3.

- Error: [1834](#) SQLSTATE: [HY000](#) ([ER\\_UNUSED5](#))

Message: Cannot delete rows from table which is parent in a foreign key constraint '%s' of table '%s'

[ER\\_UNUSED5](#) was added in 5.7.4.

- Error: [1835](#) SQLSTATE: [HY000](#) ([ER\\_MALFORMED\\_PACKET](#))

Message: Malformed communication packet.

- Error: [1836](#) SQLSTATE: [HY000](#) ([ER\\_READ\\_ONLY\\_MODE](#))

Message: Running in read-only mode

- Error: [1837](#) SQLSTATE: [HY000](#) ([ER\\_GTID\\_NEXT\\_TYPE\\_UNDEFINED\\_GROUP](#))

Message: When @@SESSION.GTID\_NEXT is set to a GTID, you must explicitly set it to a different value after a COMMIT or ROLLBACK. Please check GTID\_NEXT variable manual page for detailed explanation. Current @@SESSION.GTID\_NEXT is '%s'.

- Error: [1838](#) SQLSTATE: [HY000](#) ([ER\\_VARIABLE\\_NOT\\_SETTABLE\\_IN\\_SP](#))

Message: The system variable %s cannot be set in stored procedures.

- Error: [1839](#) SQLSTATE: [HY000](#) ([ER\\_CANT\\_SET\\_GTID\\_PURGED\\_WHEN\\_GTID\\_MODE\\_IS\\_OFF](#))

Message: @@GLOBAL.GTID\_PURGED can only be set when @@GLOBAL.GTID\_MODE = ON.

- Error: [1840](#) SQLSTATE: [HY000](#)  
([ER\\_CANT\\_SET\\_GTID\\_PURGED\\_WHEN\\_GTID\\_EXECUTED\\_IS\\_NOT\\_EMPTY](#))

Message: @@GLOBAL.GTID\_PURGED can only be set when @@GLOBAL.GTID\_EXECUTED is empty.

- Error: [1841](#) SQLSTATE: [HY000](#)  
([ER\\_CANT\\_SET\\_GTID\\_PURGED\\_WHEN\\_OWNED\\_GTIDS\\_IS\\_NOT\\_EMPTY](#))

Message: @@GLOBAL.GTID\_PURGED can only be set when there are no ongoing transactions (not even in other clients).

- Error: [1842](#) SQLSTATE: [HY000](#) ([ER\\_GTID\\_PURGED\\_WAS\\_CHANGED](#))

Message: @@GLOBAL.GTID\_PURGED was changed from '%s' to '%s'.

- Error: [1843](#) SQLSTATE: [HY000](#) ([ER\\_GTID\\_EXECUTED\\_WAS\\_CHANGED](#))

Message: @@GLOBAL.GTID\_EXECUTED was changed from '%s' to '%s'.

- Error: [1844](#) SQLSTATE: [HY000](#) ([ER\\_BINLOG\\_STMT\\_MODE\\_AND\\_NO\\_REPL\\_TABLES](#))

Message: Cannot execute statement: impossible to write to binary log since BINLOG\_FORMAT = STATEMENT, and both replicated and non replicated tables are written to.

- Error: [1845](#) SQLSTATE: [0A000](#) ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED](#))

Message: %s is not supported for this operation. Try %s.

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED](#) was added in 5.7.1.

- Error: [1846](#) SQLSTATE: [0A000](#) ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON](#))

Message: %s is not supported. Reason: %s. Try %s.

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON](#) was added in 5.7.1.

- Error: 1847 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_COPY](#))

Message: COPY algorithm requires a lock

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_COPY](#) was added in 5.7.1.

- Error: 1848 SQLSTATE: HY000  
([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_PARTITION](#))

Message: Partition specific operations do not yet support LOCK/ALGORITHM

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_PARTITION](#) was added in 5.7.1.

- Error: 1849 SQLSTATE: HY000  
([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FK\\_RENAME](#))

Message: Columns participating in a foreign key are renamed

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FK\\_RENAME](#) was added in 5.7.1.

- Error: 1850 SQLSTATE: HY000  
([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_COLUMN\\_TYPE](#))

Message: Cannot change column type INPLACE

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_COLUMN\\_TYPE](#) was added in 5.7.1.

- Error: 1851 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FK\\_CHECK](#))

Message: Adding foreign keys needs foreign\_key\_checks=OFF

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FK\\_CHECK](#) was added in 5.7.1.

- Error: 1852 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_IGNORE](#))

Message: Creating unique indexes with IGNORE requires COPY algorithm to remove duplicate rows

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_IGNORE](#) was added in 5.7.1, removed after 5.7.3.

- Error: 1852 SQLSTATE: HY000 ([ER\\_UNUSED6](#))

Message: Creating unique indexes with IGNORE requires COPY algorithm to remove duplicate rows

[ER\\_UNUSED6](#) was added in 5.7.4.

- Error: 1853 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOPK](#))

Message: Dropping a primary key is not allowed without also adding a new primary key

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOPK](#) was added in 5.7.1.

- Error: 1854 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_AUTOINC](#))

Message: Adding an auto-increment column requires a lock

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_AUTOINC](#) was added in 5.7.1.

- Error: 1855 SQLSTATE: HY000  
([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_HIDDEN\\_FTS](#))

Message: Cannot replace hidden FTS\_DOC\_ID with a user-visible one

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_HIDDEN\\_FTS](#) was added in 5.7.1.

- Error: [1856](#) SQLSTATE: [HY000](#) ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_CHANGE\\_FTS](#))

Message: Cannot drop or rename FTS\_DOC\_ID

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_CHANGE\\_FTS](#) was added in 5.7.1.

- Error: [1857](#) SQLSTATE: [HY000](#) ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FTS](#))

Message: Fulltext index creation requires a lock

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FTS](#) was added in 5.7.1.

- Error: [1858](#) SQLSTATE: [HY000](#) ([ER\\_SQL\\_SLAVE\\_SKIP\\_COUNTER\\_NOT\\_SETTABLE\\_IN\\_GTID\\_MODE](#))

Message: sql\_slave\_skip\_counter can not be set when the server is running with @@GLOBAL.GTID\_MODE = ON. Instead, for each transaction that you want to skip, generate an empty transaction with the same GTID as the transaction

[ER\\_SQL\\_SLAVE\\_SKIP\\_COUNTER\\_NOT\\_SETTABLE\\_IN\\_GTID\\_MODE](#) was added in 5.7.1.

- Error: [1859](#) SQLSTATE: [23000](#) ([ER\\_DUP\\_UNKNOWN\\_IN\\_INDEX](#))

Message: Duplicate entry for key '%s'

[ER\\_DUP\\_UNKNOWN\\_IN\\_INDEX](#) was added in 5.7.1.

- Error: [1860](#) SQLSTATE: [HY000](#) ([ER\\_IDENT\\_CAUSES\\_TOO\\_LONG\\_PATH](#))

Message: Long database name and identifier for object resulted in path length exceeding %d characters. Path: '%s'.

[ER\\_IDENT\\_CAUSES\\_TOO\\_LONG\\_PATH](#) was added in 5.7.1.

- Error: [1861](#) SQLSTATE: [HY000](#) ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOT\\_NULL](#))

Message: cannot silently convert NULL values, as required in this SQL\_MODE

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOT\\_NULL](#) was added in 5.7.1.

- Error: [1862](#) SQLSTATE: [HY000](#) ([ER\\_MUST\\_CHANGE\\_PASSWORD\\_LOGIN](#))

Message: Your password has expired. To log in you must change it using a client that supports expired passwords.

[ER\\_MUST\\_CHANGE\\_PASSWORD\\_LOGIN](#) was added in 5.7.1.

- Error: [1863](#) SQLSTATE: [HY000](#) ([ER\\_ROW\\_IN\\_WRONG\\_PARTITION](#))

Message: Found a row in wrong partition %s

[ER\\_ROW\\_IN\\_WRONG\\_PARTITION](#) was added in 5.7.1.

- Error: [1864](#) SQLSTATE: [HY000](#) ([ER\\_MTS\\_EVENT\\_BIGGER\\_PENDING\\_JOBS\\_SIZE\\_MAX](#))

Message: Cannot schedule event %s, relay-log name %s, position %s to Worker thread because its size %lu exceeds %lu of slave\_pending\_jobs\_size\_max.

[ER\\_MTS\\_EVENT\\_BIGGER\\_PENDING\\_JOBS\\_SIZE\\_MAX](#) was added in 5.7.2.

- Error: 1865 SQLSTATE: HY000 ([ER\\_INNODB\\_NO\\_FT\\_USES\\_PARSER](#))  
Message: Cannot CREATE FULLTEXT INDEX WITH PARSER on InnoDB table  
[ER\\_INNODB\\_NO\\_FT\\_USES\\_PARSER](#) was added in 5.7.2.
- Error: 1866 SQLSTATE: HY000 ([ER\\_BINLOG\\_LOGICAL\\_CORRUPTION](#))  
Message: The binary log file '%s' is logically corrupted: %s  
[ER\\_BINLOG\\_LOGICAL\\_CORRUPTION](#) was added in 5.7.2.
- Error: 1867 SQLSTATE: HY000 ([ER\\_WARN\\_PURGE\\_LOG\\_IN\\_USE](#))  
Message: file %s was not purged because it was being read by %d thread(s), purged only %d out of %d files.  
[ER\\_WARN\\_PURGE\\_LOG\\_IN\\_USE](#) was added in 5.7.2.
- Error: 1868 SQLSTATE: HY000 ([ER\\_WARN\\_PURGE\\_LOG\\_IS\\_ACTIVE](#))  
Message: file %s was not purged because it is the active log file.  
[ER\\_WARN\\_PURGE\\_LOG\\_IS\\_ACTIVE](#) was added in 5.7.2.
- Error: 1869 SQLSTATE: HY000 ([ER\\_AUTO\\_INCREMENT\\_CONFLICT](#))  
Message: Auto-increment value in UPDATE conflicts with internally generated values  
[ER\\_AUTO\\_INCREMENT\\_CONFLICT](#) was added in 5.7.2.
- Error: 1870 SQLSTATE: HY000 ([WARN\\_ON\\_BLOCKHOLE\\_IN\\_RBR](#))  
Message: Row events are not logged for %s statements that modify BLACKHOLE tables in row format. Table(s): '%s'  
[WARN\\_ON\\_BLOCKHOLE\\_IN\\_RBR](#) was added in 5.7.2.
- Error: 1871 SQLSTATE: HY000 ([ER\\_SLAVE\\_MI\\_INIT\\_REPOSITORY](#))  
Message: Slave failed to initialize master info structure from the repository  
[ER\\_SLAVE\\_MI\\_INIT\\_REPOSITORY](#) was added in 5.7.2.
- Error: 1872 SQLSTATE: HY000 ([ER\\_SLAVE\\_RLI\\_INIT\\_REPOSITORY](#))  
Message: Slave failed to initialize relay log info structure from the repository  
[ER\\_SLAVE\\_RLI\\_INIT\\_REPOSITORY](#) was added in 5.7.2.
- Error: 1873 SQLSTATE: 28000 ([ER\\_ACCESS\\_DENIED\\_CHANGE\\_USER\\_ERROR](#))  
Message: Access denied trying to change to user '%s'@'%s' (using password: %s). Disconnecting.  
[ER\\_ACCESS\\_DENIED\\_CHANGE\\_USER\\_ERROR](#) was added in 5.7.2.
- Error: 1874 SQLSTATE: HY000 ([ER\\_INNODB\\_READ\\_ONLY](#))  
Message: InnoDB is in read only mode.  
[ER\\_INNODB\\_READ\\_ONLY](#) was added in 5.7.2.

- Error: 1875 SQLSTATE: HY000 (ER\_STOP\_SLAVE\_SQL\_THREAD\_TIMEOUT)

Message: STOP SLAVE command execution is incomplete: Slave SQL thread got the stop signal, thread is busy, SQL thread will stop once the current task is complete.

ER\_STOP\_SLAVE\_SQL\_THREAD\_TIMEOUT was added in 5.7.2.

- Error: 1876 SQLSTATE: HY000 (ER\_STOP\_SLAVE\_IO\_THREAD\_TIMEOUT)

Message: STOP SLAVE command execution is incomplete: Slave IO thread got the stop signal, thread is busy, IO thread will stop once the current task is complete.

ER\_STOP\_SLAVE\_IO\_THREAD\_TIMEOUT was added in 5.7.2.

- Error: 1877 SQLSTATE: HY000 (ER\_TABLE\_CORRUPT)

Message: Operation cannot be performed. The table '%s.%s' is missing, corrupt or contains bad data.

ER\_TABLE\_CORRUPT was added in 5.7.2.

- Error: 1878 SQLSTATE: HY000 (ER\_TEMP\_FILE\_WRITE\_FAILURE)

Message: Temporary file write failure.

ER\_TEMP\_FILE\_WRITE\_FAILURE was added in 5.7.3.

- Error: 1879 SQLSTATE: HY000 (ER\_INNODB\_FT\_AUX\_NOT\_HEX\_ID)

Message: Upgrade index name failed, please use create index(alter table) algorithm copy to rebuild index.

ER\_INNODB\_FT\_AUX\_NOT\_HEX\_ID was added in 5.7.4.

- Error: 1880 SQLSTATE: HY000 (ER\_OLD\_TEMPORALS\_UPGRADED)

Message: TIME/TIMESTAMP/DATETIME columns of old format have been upgraded to the new format.

ER\_OLD\_TEMPORALS\_UPGRADED was added in 5.7.4.

- Error: 1881 SQLSTATE: HY000 (ER\_INNODB\_FORCED\_RECOVERY)

Message: Operation not allowed when innodb\_forced\_recovery > 0.

ER\_INNODB\_FORCED\_RECOVERY was added in 5.7.4.

- Error: 1882 SQLSTATE: HY000 (ER\_AES\_INVALID\_IV)

Message: The initialization vector supplied to %s is too short. Must be at least %d bytes long

ER\_AES\_INVALID\_IV was added in 5.7.4.

- Error: 1883 SQLSTATE: HY000 (ER\_PLUGIN\_CANNOT\_BE\_UNINSTALLED)

Message: Plugin '%s' cannot be uninstalled now. %s

ER\_PLUGIN\_CANNOT\_BE\_UNINSTALLED was added in 5.7.5.

- Error: 1884 SQLSTATE: HY000  
(ER\_GTID\_UNSAFE\_BINLOG\_SPLITTABLE\_STATEMENT\_AND\_GTID\_GROUP)

Message: Cannot execute statement because it needs to be written to the binary log as multiple statements, and this is not allowed when @@SESSION.GTID\_NEXT == 'UUID:NUMBER'.

[ER\\_GTID\\_UNSAFE\\_BINLOG\\_SPLITTABLE\\_STATEMENT\\_AND\\_GTID\\_GROUP](#) was added in 5.7.5.

- Error: 1885 SQLSTATE: HY000 ([ER\\_SLAVE\\_HAS\\_MORE\\_GTIDS\\_THAN\\_MASTER](#))

Message: Slave has more GTIDs than the master has, using the master's SERVER\_UUID. This may indicate that the end of the binary log was truncated or that the last binary log file was lost, e.g., after a power or disk failure when sync\_binlog != 1. The master may or may not have rolled back transactions that were already replicated to the slave. Suggest to replicate any transactions that master has rolled back from slave to master, and/or commit empty transactions on master to account for transactions that have been committed on master but are not included in GTID\_EXECUTED.

[ER\\_SLAVE\\_HAS\\_MORE\\_GTIDS\\_THAN\\_MASTER](#) was added in 5.7.6.

- Error: 1906 SQLSTATE: HY000 ([ER\\_SLAVE\\_IO\\_THREAD\\_MUST\\_STOP](#))

Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO\_THREAD first.

[ER\\_SLAVE\\_IO\\_THREAD\\_MUST\\_STOP](#) was added in 5.7.4, removed after 5.7.5.

- Error: 3000 SQLSTATE: HY000 ([ER\\_FILE\\_CORRUPT](#))

Message: File %s is corrupted

- Error: 3001 SQLSTATE: HY000 ([ER\\_ERROR\\_ON\\_MASTER](#))

Message: Query partially completed on the master (error on master: %d) and was aborted. There is a chance that your master is inconsistent at this point. If you are sure that your master is ok, run this query manually on the slave and then restart the slave with SET GLOBAL SQL\_SLAVE\_SKIP\_COUNTER=1; START SLAVE;. Query: '%s'

- Error: 3002 SQLSTATE: HY000 ([ER\\_INCONSISTENT\\_ERROR](#))

Message: Query caused different errors on master and slave. Error on master: message (format)='%s' error code=%d; Error on slave: actual message='%s', error code=%d. Default database: '%s'. Query: '%s'

- Error: 3003 SQLSTATE: HY000 ([ER\\_STORAGE\\_ENGINE\\_NOT\\_LOADED](#))

Message: Storage engine for table '%s'. '%s' is not loaded.

- Error: 3004 SQLSTATE: 0Z002 ([ER\\_GET\\_STACKED\\_DA\\_WITHOUT\\_ACTIVE\\_HANDLER](#))

Message: GET STACKED DIAGNOSTICS when handler not active

- Error: 3005 SQLSTATE: HY000 ([ER\\_WARN\\_LEGACY\\_SYNTAX\\_CONVERTED](#))

Message: %s is no longer supported. The statement was converted to %s.

- Error: 3006 SQLSTATE: HY000 ([ER\\_BINLOG\\_UNSAFE\\_FULLTEXT\\_PLUGIN](#))

Message: Statement is unsafe because it uses a fulltext parser plugin which may not return the same value on the slave.

[ER\\_BINLOG\\_UNSAFE\\_FULLTEXT\\_PLUGIN](#) was added in 5.7.1.

- Error: 3007 SQLSTATE: HY000 ([ER\\_CANNOT\\_DISCARD\\_TEMPORARY\\_TABLE](#))

Message: Cannot DISCARD/IMPORT tablespace associated with temporary table

[ER\\_CANNOT\\_DISCARD\\_TEMPORARY\\_TABLE](#) was added in 5.7.1.

- Error: 3008 SQLSTATE: HY000 ([ER\\_FK\\_DEPTH\\_EXCEEDED](#))

Message: Foreign key cascade delete/update exceeds max depth of %d.

[ER\\_FK\\_DEPTH\\_EXCEEDED](#) was added in 5.7.2.

- Error: 3009 SQLSTATE: HY000 ([ER\\_COL\\_COUNT\\_DOESNT\\_MATCH\\_PLEASE\\_UPDATE\\_V2](#))

Message: Column count of %s.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql\_upgrade to fix this error.

[ER\\_COL\\_COUNT\\_DOESNT\\_MATCH\\_PLEASE\\_UPDATE\\_V2](#) was added in 5.7.2.

- Error: 3010 SQLSTATE: HY000 ([ER\\_WARN\\_TRIGGER\\_DOESNT\\_HAVE\\_CREATED](#))

Message: Trigger %s.%s.%s does not have CREATED attribute.

[ER\\_WARN\\_TRIGGER\\_DOESNT\\_HAVE\\_CREATED](#) was added in 5.7.2.

- Error: 3011 SQLSTATE: HY000 ([ER\\_REFERENCED\\_TRG\\_DOES\\_NOT\\_EXIST](#))

Message: Referenced trigger '%s' for the given action time and event type does not exist.

[ER\\_REFERENCED\\_TRG\\_DOES\\_NOT\\_EXIST](#) was added in 5.7.2.

- Error: 3012 SQLSTATE: HY000 ([ER\\_EXPLAIN\\_NOT\\_SUPPORTED](#))

Message: EXPLAIN FOR CONNECTION command is supported only for SELECT/UPDATE/INSERT/DELETE/REPLACE

[ER\\_EXPLAIN\\_NOT\\_SUPPORTED](#) was added in 5.7.2.

- Error: 3013 SQLSTATE: HY000 ([ER\\_INVALID\\_FIELD\\_SIZE](#))

Message: Invalid size for column '%s'.

[ER\\_INVALID\\_FIELD\\_SIZE](#) was added in 5.7.2.

- Error: 3014 SQLSTATE: HY000 ([ER\\_MISSING\\_HA\\_CREATE\\_OPTION](#))

Message: Table storage engine '%s' found required create option missing

[ER\\_MISSING\\_HA\\_CREATE\\_OPTION](#) was added in 5.7.2.

- Error: 3015 SQLSTATE: HY000 ([ER\\_ENGINE\\_OUT\\_OF\\_MEMORY](#))

Message: Out of memory in storage engine '%s'.

[ER\\_ENGINE\\_OUT\\_OF\\_MEMORY](#) was added in 5.7.3.

- Error: 3016 SQLSTATE: HY000 ([ER\\_PASSWORD\\_EXPIRE\\_ANONYMOUS\\_USER](#))

Message: The password for anonymous user cannot be expired.

[ER\\_PASSWORD\\_EXPIRE\\_ANONYMOUS\\_USER](#) was added in 5.7.3.

- Error: 3017 SQLSTATE: HY000 ([ER\\_SLAVE\\_SQL\\_THREAD\\_MUST\\_STOP](#))

Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL\_THREAD first

[ER\\_SLAVE\\_SQL\\_THREAD\\_MUST\\_STOP](#) was added in 5.7.3.

- Error: 3018 SQLSTATE: HY000 ([ER\\_NO\\_FT\\_MATERIALIZED\\_SUBQUERY](#))

Message: Cannot create FULLTEXT index on materialized subquery

[ER\\_NO\\_FT\\_MATERIALIZED\\_SUBQUERY](#) was added in 5.7.4.

- Error: 3019 SQLSTATE: HY000 ([ER\\_INNODB\\_UNDO\\_LOG\\_FULL](#))

Message: Undo Log error: %s

[ER\\_INNODB\\_UNDO\\_LOG\\_FULL](#) was added in 5.7.4.

- Error: 3020 SQLSTATE: 2201E ([ER\\_INVALID\\_ARGUMENT\\_FOR\\_LOGARITHM](#))

Message: Invalid argument for logarithm

[ER\\_INVALID\\_ARGUMENT\\_FOR\\_LOGARITHM](#) was added in 5.7.4.

- Error: 3021 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_IO\\_THREAD\\_MUST\\_STOP](#))

Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO\_THREAD FOR CHANNEL '%s' first.

[ER\\_SLAVE\\_CHANNEL\\_IO\\_THREAD\\_MUST\\_STOP](#) was added in 5.7.6.

- Error: 3022 SQLSTATE: HY000 ([ER\\_WARN\\_OPEN\\_TEMP\\_TABLES\\_MUST\\_BE\\_ZERO](#))

Message: This operation may not be safe when the slave has temporary tables. The tables will be kept open until the server restarts or until the tables are deleted by any replicated DROP statement. Suggest to wait until slave\_open\_temp\_tables = 0.

[ER\\_WARN\\_OPEN\\_TEMP\\_TABLES\\_MUST\\_BE\\_ZERO](#) was added in 5.7.4.

- Error: 3023 SQLSTATE: HY000 ([ER\\_WARN\\_ONLY\\_MASTER\\_LOG\\_FILE\\_NO\\_POS](#))

Message: CHANGE MASTER TO with a MASTER\_LOG\_FILE clause but no MASTER\_LOG\_POS clause may not be safe. The old position value may not be valid for the new binary log file.

[ER\\_WARN\\_ONLY\\_MASTER\\_LOG\\_FILE\\_NO\\_POS](#) was added in 5.7.4.

- Error: 3024 SQLSTATE: HY000 ([ER\\_QUERY\\_TIMEOUT](#))

Message: Query execution was interrupted, maximum statement execution time exceeded

[ER\\_QUERY\\_TIMEOUT](#) was added in 5.7.4.

- Error: 3025 SQLSTATE: HY000 ([ER\\_NON\\_RO\\_SELECT\\_DISABLE\\_TIMER](#))

Message: Select is not a read only statement, disabling timer

[ER\\_NON\\_RO\\_SELECT\\_DISABLE\\_TIMER](#) was added in 5.7.4.

- Error: 3026 SQLSTATE: HY000 ([ER\\_DUP\\_LIST\\_ENTRY](#))

Message: Duplicate entry '%s'.

[ER\\_DUP\\_LIST\\_ENTRY](#) was added in 5.7.4.

- Error: 3027 SQLSTATE: HY000 ([ER\\_SQL\\_MODE\\_NO\\_EFFECT](#))

Message: '%s' mode no longer has any effect. Use STRICT\_ALL\_TABLES or STRICT\_TRANS\_TABLES instead.

[ER\\_SQL\\_MODE\\_NO\\_EFFECT](#) was added in 5.7.4.

- Error: 3028 SQLSTATE: HY000 ([ER\\_AGGREGATE\\_ORDER\\_FOR\\_UNION](#))

Message: Expression #%u of ORDER BY contains aggregate function and applies to a UNION

[ER\\_AGGREGATE\\_ORDER\\_FOR\\_UNION](#) was added in 5.7.5.

- Error: 3029 SQLSTATE: HY000 ([ER\\_AGGREGATE\\_ORDER\\_NON\\_AGG\\_QUERY](#))

Message: Expression #%u of ORDER BY contains aggregate function and applies to the result of a non-aggregated query

[ER\\_AGGREGATE\\_ORDER\\_NON\\_AGG\\_QUERY](#) was added in 5.7.5.

- Error: 3030 SQLSTATE: HY000 ([ER\\_SLAVE\\_WORKER\\_STOPPED\\_PREVIOUS\\_THD\\_ERROR](#))

Message: Slave worker has stopped after at least one previous worker encountered an error when slave-preserve-commit-order was enabled. To preserve commit order, the last transaction executed by this thread has not been committed. When restarting the slave after fixing any failed threads, you should fix this worker as well.

[ER\\_SLAVE\\_WORKER\\_STOPPED\\_PREVIOUS\\_THD\\_ERROR](#) was added in 5.7.5.

- Error: 3031 SQLSTATE: HY000 ([ER\\_DONT\\_SUPPORT\\_SLAVE\\_PRESERVE\\_COMMIT\\_ORDER](#))

Message: slave\_preserve\_commit\_order is not supported %s.

[ER\\_DONT\\_SUPPORT\\_SLAVE\\_PRESERVE\\_COMMIT\\_ORDER](#) was added in 5.7.5.

- Error: 3032 SQLSTATE: HY000 ([ER\\_SERVER\\_OFFLINE\\_MODE](#))

Message: The server is currently in offline mode

[ER\\_SERVER\\_OFFLINE\\_MODE](#) was added in 5.7.5.

- Error: 3033 SQLSTATE: HY000 ([ER\\_GIS\\_DIFFERENT\\_SRIDS](#))

Message: Binary geometry function %s given two geometries of different srids: %u and %u, which should have been identical.

Geometry values passed as arguments to spatial functions must have the same SRID value.

[ER\\_GIS\\_DIFFERENT\\_SRIDS](#) was added in 5.7.5.

- Error: 3034 SQLSTATE: HY000 ([ER\\_GIS\\_UNSUPPORTED\\_ARGUMENT](#))

Message: Calling geometry function %s with unsupported types of arguments.

A spatial function was called with a combination of argument types that the function does not support.

[ER\\_GIS\\_UNSUPPORTED\\_ARGUMENT](#) was added in 5.7.5.

- Error: 3035 SQLSTATE: HY000 ([ER\\_GIS\\_UNKNOWN\\_ERROR](#))

Message: Unknown GIS error occurred in function %s.

[ER\\_GIS\\_UNKNOWN\\_ERROR](#) was added in 5.7.5.

- Error: 3036 SQLSTATE: HY000 ([ER\\_GIS\\_UNKNOWN\\_EXCEPTION](#))

Message: Unknown exception caught in GIS function %s.

[ER\\_GIS\\_UNKNOWN\\_EXCEPTION](#) was added in 5.7.5.

- Error: 3037 SQLSTATE: 22023 (ER\_GIS\_INVALID\_DATA)  
Message: Invalid GIS data provided to function %s.  
A spatial function was called with an argument not recognized as a valid geometry value.  
ER\_GIS\_INVALID\_DATA was added in 5.7.5.
- Error: 3038 SQLSTATE: HY000 (ER\_BOOST\_GEOMETRY\_EMPTY\_INPUT\_EXCEPTION)  
Message: The geometry has no data in function %s.  
ER\_BOOST\_GEOMETRY\_EMPTY\_INPUT\_EXCEPTION was added in 5.7.5.
- Error: 3039 SQLSTATE: HY000 (ER\_BOOST\_GEOMETRY\_CENTROID\_EXCEPTION)  
Message: Unable to calculate centroid because geometry is empty in function %s.  
ER\_BOOST\_GEOMETRY\_CENTROID\_EXCEPTION was added in 5.7.5.
- Error: 3040 SQLSTATE: HY000 (ER\_BOOST\_GEOMETRY\_OVERLAY\_INVALID\_INPUT\_EXCEPTION)  
Message: Geometry overlay calculation error: geometry data is invalid in function %s.  
ER\_BOOST\_GEOMETRY\_OVERLAY\_INVALID\_INPUT\_EXCEPTION was added in 5.7.5.
- Error: 3041 SQLSTATE: HY000 (ER\_BOOST\_GEOMETRY\_TURN\_INFO\_EXCEPTION)  
Message: Geometry turn info calculation error: geometry data is invalid in function %s.  
ER\_BOOST\_GEOMETRY\_TURN\_INFO\_EXCEPTION was added in 5.7.5.
- Error: 3042 SQLSTATE: HY000 (ER\_BOOST\_GEOMETRY\_SELF\_INTERSECTION\_POINT\_EXCEPTION)  
Message: Analysis procedures of intersection points interrupted unexpectedly in function %s.  
ER\_BOOST\_GEOMETRY\_SELF\_INTERSECTION\_POINT\_EXCEPTION was added in 5.7.5.
- Error: 3043 SQLSTATE: HY000 (ER\_BOOST\_GEOMETRY\_UNKNOWN\_EXCEPTION)  
Message: Unknown exception thrown in function %s.  
ER\_BOOST\_GEOMETRY\_UNKNOWN\_EXCEPTION was added in 5.7.5.
- Error: 3044 SQLSTATE: HY000 (ER\_STD\_BAD\_ALLOC\_ERROR)  
Message: Memory allocation error: %s in function %s.  
ER\_STD\_BAD\_ALLOC\_ERROR was added in 5.7.5.
- Error: 3045 SQLSTATE: HY000 (ER\_STD\_DOMAIN\_ERROR)  
Message: Domain error: %s in function %s.  
ER\_STD\_DOMAIN\_ERROR was added in 5.7.5.
- Error: 3046 SQLSTATE: HY000 (ER\_STD\_LENGTH\_ERROR)  
Message: Length error: %s in function %s.  
ER\_STD\_LENGTH\_ERROR was added in 5.7.5.

- Error: 3047 SQLSTATE: HY000 (ER\_STD\_INVALID\_ARGUMENT)  
Message: Invalid argument error: %s in function %s.  
[ER\\_STD\\_INVALID\\_ARGUMENT](#) was added in 5.7.5.
- Error: 3048 SQLSTATE: HY000 (ER\_STD\_OUT\_OF\_RANGE\_ERROR)  
Message: Out of range error: %s in function %s.  
[ER\\_STD\\_OUT\\_OF\\_RANGE\\_ERROR](#) was added in 5.7.5.
- Error: 3049 SQLSTATE: HY000 (ER\_STD\_OVERFLOW\_ERROR)  
Message: Overflow error error: %s in function %s.  
[ER\\_STD\\_OVERFLOW\\_ERROR](#) was added in 5.7.5.
- Error: 3050 SQLSTATE: HY000 (ER\_STD\_RANGE\_ERROR)  
Message: Range error: %s in function %s.  
[ER\\_STD\\_RANGE\\_ERROR](#) was added in 5.7.5.
- Error: 3051 SQLSTATE: HY000 (ER\_STD\_UNDERFLOW\_ERROR)  
Message: Underflow error: %s in function %s.  
[ER\\_STD\\_UNDERFLOW\\_ERROR](#) was added in 5.7.5.
- Error: 3052 SQLSTATE: HY000 (ER\_STD\_LOGIC\_ERROR)  
Message: Logic error: %s in function %s.  
[ER\\_STD\\_LOGIC\\_ERROR](#) was added in 5.7.5.
- Error: 3053 SQLSTATE: HY000 (ER\_STD\_RUNTIME\_ERROR)  
Message: Runtime error: %s in function %s.  
[ER\\_STD\\_RUNTIME\\_ERROR](#) was added in 5.7.5.
- Error: 3054 SQLSTATE: HY000 (ER\_STD\_UNKNOWN\_EXCEPTION)  
Message: Unknown exception: %s in function %s.  
[ER\\_STD\\_UNKNOWN\\_EXCEPTION](#) was added in 5.7.5.
- Error: 3055 SQLSTATE: HY000 (ER\_GIS\_DATA\_WRONG\_ENDIANESS)  
Message: Geometry byte string must be little endian.  
[ER\\_GIS\\_DATA\\_WRONG\\_ENDIANESS](#) was added in 5.7.5.
- Error: 3056 SQLSTATE: HY000 (ER\_CHANGE\_MASTER\_PASSWORD\_LENGTH)  
Message: The password provided for the replication user exceeds the maximum length of 32 characters  
[ER\\_CHANGE\\_MASTER\\_PASSWORD\\_LENGTH](#) was added in 5.7.5.
- Error: 3057 SQLSTATE: 42000 (ER\_USER\_LOCK\_WRONG\_NAME)  
Message: Incorrect user-level lock name '%s'.

[ER\\_USER\\_LOCK\\_WRONG\\_NAME](#) was added in 5.7.5.

- Error: 3058 SQLSTATE: HY000 ([ER\\_USER\\_LOCK\\_DEADLOCK](#))

Message: Deadlock found when trying to get user-level lock; try rolling back transaction/releasing locks and restarting lock acquisition.

This error is returned when the metadata locking subsystem detects a deadlock for an attempt to acquire a named lock with [GET\\_LOCK](#).

[ER\\_USER\\_LOCK\\_DEADLOCK](#) was added in 5.7.5.

- Error: 3059 SQLSTATE: HY000 ([ER\\_REPLACE\\_INACCESSIBLE\\_ROWS](#))

Message: REPLACE cannot be executed as it requires deleting rows that are not in the view

[ER\\_REPLACE\\_INACCESSIBLE\\_ROWS](#) was added in 5.7.5.

- Error: 3060 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_GIS](#))

Message: Do not support online operation on table with GIS index

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_GIS](#) was added in 5.7.5.

- Error: 3061 SQLSTATE: 42000 ([ER\\_ILLEGAL\\_USER\\_VAR](#))

Message: User variable name '%s' is illegal

[ER\\_ILLEGAL\\_USER\\_VAR](#) was added in 5.7.5.

- Error: 3062 SQLSTATE: HY000 ([ER\\_GTID\\_MODE\\_OFF](#))

Message: Cannot %s when GTID\_MODE = OFF.

[ER\\_GTID\\_MODE\\_OFF](#) was added in 5.7.5.

- Error: 3063 SQLSTATE: HY000 ([ER\\_UNSUPPORTED\\_BY\\_REPLICATION\\_THREAD](#))

Message: Cannot %s from a replication slave thread.

[ER\\_UNSUPPORTED\\_BY\\_REPLICATION\\_THREAD](#) was added in 5.7.5.

- Error: 3064 SQLSTATE: HY000 ([ER\\_INCORRECT\\_TYPE](#))

Message: Incorrect type for argument %s in function %s.

[ER\\_INCORRECT\\_TYPE](#) was added in 5.7.5.

- Error: 3065 SQLSTATE: HY000 ([ER\\_FIELD\\_IN\\_ORDER\\_NOT\\_SELECT](#))

Message: Expression #%u of ORDER BY clause is not in SELECT list, references column '%s' which is not in SELECT list; this is incompatible with %s

[ER\\_FIELD\\_IN\\_ORDER\\_NOT\\_SELECT](#) was added in 5.7.5.

- Error: 3066 SQLSTATE: HY000 ([ER\\_AGGREGATE\\_IN\\_ORDER\\_NOT\\_SELECT](#))

Message: Expression #%u of ORDER BY clause is not in SELECT list, contains aggregate function; this is incompatible with %s

[ER\\_AGGREGATE\\_IN\\_ORDER\\_NOT\\_SELECT](#) was added in 5.7.5.

- Error: 3067 SQLSTATE: HY000 ([ER\\_INVALID\\_RPL\\_WILD\\_TABLE\\_FILTER\\_PATTERN](#))

Message: Supplied filter list contains a value which is not in the required format 'db\_pattern.table\_pattern'

[ER\\_INVALID\\_RPL\\_WILD\\_TABLE\\_FILTER\\_PATTERN](#) was added in 5.7.5.

- Error: 3068 SQLSTATE: 08S01 ([ER\\_NET\\_OK\\_PACKET\\_TOO\\_LARGE](#))

Message: OK packet too large

[ER\\_NET\\_OK\\_PACKET\\_TOO\\_LARGE](#) was added in 5.7.5.

- Error: 3069 SQLSTATE: HY000 ([ER\\_INVALID\\_JSON\\_DATA](#))

Message: Invalid JSON data provided to function %s: %s

[ER\\_INVALID\\_JSON\\_DATA](#) was added in 5.7.5.

- Error: 3070 SQLSTATE: HY000 ([ER\\_INVALID\\_GEOJSON\\_MISSING\\_MEMBER](#))

Message: Invalid GeoJSON data provided to function %s: Missing required member '%s'

[ER\\_INVALID\\_GEOJSON\\_MISSING\\_MEMBER](#) was added in 5.7.5.

- Error: 3071 SQLSTATE: HY000 ([ER\\_INVALID\\_GEOJSON\\_WRONG\\_TYPE](#))

Message: Invalid GeoJSON data provided to function %s: Member '%s' must be of type '%s'

[ER\\_INVALID\\_GEOJSON\\_WRONG\\_TYPE](#) was added in 5.7.5.

- Error: 3072 SQLSTATE: HY000 ([ER\\_INVALID\\_GEOJSON\\_UNSPECIFIED](#))

Message: Invalid GeoJSON data provided to function %s

[ER\\_INVALID\\_GEOJSON\\_UNSPECIFIED](#) was added in 5.7.5.

- Error: 3073 SQLSTATE: HY000 ([ER\\_DIMENSION\\_UNSUPPORTED](#))

Message: Unsupported number of coordinate dimensions in function %s: Found %u, expected %u

[ER\\_DIMENSION\\_UNSUPPORTED](#) was added in 5.7.5.

- Error: 3074 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_DOES\\_NOT\\_EXIST](#))

Message: Slave channel '%s' does not exist.

[ER\\_SLAVE\\_CHANNEL\\_DOES\\_NOT\\_EXIST](#) was added in 5.7.6.

- Error: 3075 SQLSTATE: HY000 ([ER\\_SLAVE\\_MULTIPLE\\_CHANNELS\\_HOST\\_PORT](#))

Message: A slave channel '%s' already exists for the given host and port combination.

[ER\\_SLAVE\\_MULTIPLE\\_CHANNELS\\_HOST\\_PORT](#) was added in 5.7.6.

- Error: 3076 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_NAME\\_INVALID\\_OR\\_TOO\\_LONG](#))

Message: Couldn't create channel: Channel name is either invalid or too long.

[ER\\_SLAVE\\_CHANNEL\\_NAME\\_INVALID\\_OR\\_TOO\\_LONG](#) was added in 5.7.6.

- Error: 3077 SQLSTATE: HY000 ([ER\\_SLAVE\\_NEW\\_CHANNEL\\_WRONG\\_REPOSITORY](#))

Message: To have multiple channels, repository cannot be of type FILE; Please check the repository configuration and convert them to TABLE.

`ER_SLAVE_NEW_CHANNEL_WRONG_REPOSITORY` was added in 5.7.6.

- Error: 3078 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_DELETE`)

Message: Cannot delete slave info objects for channel '%s'.

`ER_SLAVE_CHANNEL_DELETE` was added in 5.7.6.

- Error: 3079 SQLSTATE: HY000 (`ER_SLAVE_MULTIPLE_CHANNELS_CMD`)

Message: Multiple channels exist on the slave. Please provide channel name as an argument.

`ER_SLAVE_MULTIPLE_CHANNELS_CMD` was added in 5.7.6.

- Error: 3080 SQLSTATE: HY000 (`ER_SLAVE_MAX_CHANNELS_EXCEEDED`)

Message: Maximum number of replication channels allowed exceeded.

`ER_SLAVE_MAX_CHANNELS_EXCEEDED` was added in 5.7.6.

- Error: 3081 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_MUST_STOP`)

Message: This operation cannot be performed with running replication threads; run STOP SLAVE FOR CHANNEL '%s' first

`ER_SLAVE_CHANNEL_MUST_STOP` was added in 5.7.6.

- Error: 3082 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_NOT_RUNNING`)

Message: This operation requires running replication threads; configure slave and run START SLAVE FOR CHANNEL '%s'

`ER_SLAVE_CHANNEL_NOT_RUNNING` was added in 5.7.6.

- Error: 3083 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_WAS_RUNNING`)

Message: Replication thread(s) for channel '%s' are already running.

`ER_SLAVE_CHANNEL_WAS_RUNNING` was added in 5.7.6.

- Error: 3084 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_WAS_NOT_RUNNING`)

Message: Replication thread(s) for channel '%s' are already stopped.

`ER_SLAVE_CHANNEL_WAS_NOT_RUNNING` was added in 5.7.6.

- Error: 3085 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP`)

Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL\_THREAD FOR CHANNEL '%s' first.

`ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP` was added in 5.7.6.

- Error: 3086 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER`)

Message: When `sql_slave_skip_counter > 0`, it is not allowed to start more than one SQL thread by using 'START SLAVE [SQL\_THREAD]'. Value of `sql_slave_skip_counter` can only be used by one SQL thread at a time. Please use 'START SLAVE [SQL\_THREAD] FOR CHANNEL' to start the SQL thread which will use the value of `sql_slave_skip_counter`.

`ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER` was added in 5.7.6.

- Error: 3087 SQLSTATE: HY000 (`ER_WRONG_FIELD_WITH_GROUP_V2`)

Message: Expression #%u of %s is not in GROUP BY clause and contains nonaggregated column '%s' which is not functionally dependent on columns in GROUP BY clause; this is incompatible with sql\_mode=only\_full\_group\_by

[ER\\_WRONG\\_FIELD\\_WITH\\_GROUP\\_V2](#) was added in 5.7.6.

- Error: 3088 SQLSTATE: HY000 ([ER\\_MIX\\_OF\\_GROUP\\_FUNC\\_AND\\_FIELDS\\_V2](#))

Message: In aggregated query without GROUP BY, expression #%u of %s contains nonaggregated column '%s'; this is incompatible with sql\_mode=only\_full\_group\_by

[ER\\_MIX\\_OF\\_GROUP\\_FUNC\\_AND\\_FIELDS\\_V2](#) was added in 5.7.6.

- Error: 3089 SQLSTATE: HY000 ([ER\\_WARN\\_DEPRECATED\\_SYSVAR\\_UPDATE](#))

Message: Updating '%s' is deprecated. It will be made read-only in a future release.

[ER\\_WARN\\_DEPRECATED\\_SYSVAR\\_UPDATE](#) was added in 5.7.6.

- Error: 3090 SQLSTATE: HY000 ([ER\\_WARN\\_DEPRECATED\\_SQLMODE](#))

Message: Changing sql mode '%s' is deprecated. It will be removed in a future release.

[ER\\_WARN\\_DEPRECATED\\_SQLMODE](#) was added in 5.7.6.

- Error: 3091 SQLSTATE: HY000 ([ER\\_CANNOT\\_LOG\\_PARTIAL\\_DROP\\_DATABASE\\_WITH\\_GTID](#))

Message: DROP DATABASE failed; some tables may have been dropped but the database directory remains. The GTID has not been added to GTID\_EXECUTED and the statement was not written to the binary log. Fix this as follows: (1) remove all files from the database directory %s; (2) SET GTID\_NEXT='%s'; (3) DROP DATABASE '%s'.

[ER\\_CANNOT\\_LOG\\_PARTIAL\\_DROP\\_DATABASE\\_WITH\\_GTID](#) was added in 5.7.6.

- Error: 3092 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_CONFIGURATION](#))

Message: The server is not configured properly to be an active member of the group. Please see more details on error log.

[ER\\_GROUP\\_REPLICATION\\_CONFIGURATION](#) was added in 5.7.6.

- Error: 3093 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_RUNNING](#))

Message: The START GROUP\_REPLICATION command failed since the group is already running.

[ER\\_GROUP\\_REPLICATION\\_RUNNING](#) was added in 5.7.6.

- Error: 3094 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_APPLIER\\_INIT\\_ERROR](#))

Message: The START GROUP\_REPLICATION command failed as the applier module failed to start.

[ER\\_GROUP\\_REPLICATION\\_APPLIER\\_INIT\\_ERROR](#) was added in 5.7.6.

- Error: 3095 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_STOP\\_APPLIER\\_THREAD\\_TIMEOUT](#))

Message: The STOP GROUP\_REPLICATION command execution is incomplete: The applier thread got the stop signal while it was busy. The applier thread will stop once the current task is complete.

[ER\\_GROUP\\_REPLICATION\\_STOP\\_APPLIER\\_THREAD\\_TIMEOUT](#) was added in 5.7.6.

- Error: 3096 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_COMMUNICATION\\_LAYER\\_SESSION\\_ERROR](#))

Message: The START GROUP\_REPLICATION command failed as there was an error when initializing the group communication layer.

`ER_GROUP_REPLICATION_COMMUNICATION_LAYER_SESSION_ERROR` was added in 5.7.6.

- Error: 3097 SQLSTATE: HY000 (`ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR`)

Message: The START GROUP\_REPLICATION command failed as there was an error when joining the communication group.

`ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR` was added in 5.7.6.

- Error: 3098 SQLSTATE: HY000 (`ER_BEFORE_DML_VALIDATION_ERROR`)

Message: The table does not comply with the requirements by an external plugin.

`ER_BEFORE_DML_VALIDATION_ERROR` was added in 5.7.6.

- Error: 3099 SQLSTATE: HY000 (`ER_PREVENTS_VARIABLE_WITHOUT_RBR`)

Message: Cannot change the value of variable %s without binary log format as ROW.

`transaction_write_set_extraction` option value is set and `binlog_format` is not ROW.

`ER_PREVENTS_VARIABLE_WITHOUT_RBR` was added in 5.7.6.

- Error: 3100 SQLSTATE: HY000 (`ER_RUN_HOOK_ERROR`)

Message: Error on observer while running replication hook '%s'.

`ER_RUN_HOOK_ERROR` was added in 5.7.6.

- Error: 3101 SQLSTATE: HY000 (`ER_TRANSACTION_ROLLBACK_DURING_COMMIT`)

Message: Plugin instructed the server to rollback the current transaction.

When using Group Replication, this means that a transaction failed the group certification process, due to one or more members detecting a potential conflict, and was thus rolled back. See [Chapter 19, Group Replication](#).

`ER_TRANSACTION_ROLLBACK_DURING_COMMIT` was added in 5.7.6.

- Error: 3102 SQLSTATE: HY000 (`ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED`)

Message: Expression of generated column '%s' contains a disallowed function.

`ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED` was added in 5.7.6.

- Error: 3103 SQLSTATE: HY000 (`ER_KEY_BASED_ON_GENERATED_COLUMN`)

Message: Key/Index cannot be defined on a virtual generated column.

`ER_KEY_BASED_ON_GENERATED_COLUMN` was added in 5.7.6, removed after 5.7.7.

- Error: 3103 SQLSTATE: HY000 (`ER_UNSUPPORTED_ALTER_INPLACE_ON_VIRTUAL_COLUMN`)

Message: INPLACE ADD or DROP of virtual columns cannot be combined with other ALTER TABLE actions

`ER_UNSUPPORTED_ALTER_INPLACE_ON_VIRTUAL_COLUMN` was added in 5.7.8.

- Error: 3104 SQLSTATE: HY000 (`ER_WRONG_FK_OPTION_FOR_GENERATED_COLUMN`)

Message: Cannot define foreign key with %s clause on a generated column.

[ER\\_WRONG\\_FK\\_OPTION\\_FOR\\_GENERATED\\_COLUMN](#) was added in 5.7.6.

- Error: 3105 SQLSTATE: HY000 ([ER\\_NON\\_DEFAULT\\_VALUE\\_FOR\\_GENERATED\\_COLUMN](#))

Message: The value specified for generated column '%s' in table '%s' is not allowed.

[ER\\_NON\\_DEFAULT\\_VALUE\\_FOR\\_GENERATED\\_COLUMN](#) was added in 5.7.6.

- Error: 3106 SQLSTATE: HY000 ([ER\\_UNSUPPORTED\\_ACTION\\_ON\\_GENERATED\\_COLUMN](#))

Message: '%s' is not supported for generated columns.

[ER\\_UNSUPPORTED\\_ACTION\\_ON\\_GENERATED\\_COLUMN](#) was added in 5.7.6.

- Error: 3107 SQLSTATE: HY000 ([ER\\_GENERATED\\_COLUMN\\_NON\\_PRIOR](#))

Message: Generated column can refer only to generated columns defined prior to it.

To address this issue, change the table definition to define each generated column later than any generated columns to which it refers.

[ER\\_GENERATED\\_COLUMN\\_NON\\_PRIOR](#) was added in 5.7.6.

- Error: 3108 SQLSTATE: HY000 ([ER\\_DEPENDENT\\_BY\\_GENERATED\\_COLUMN](#))

Message: Column '%s' has a generated column dependency.

You cannot drop or rename a generated column if another column refers to it. You must either drop those columns as well, or redefine them not to refer to the generated column.

[ER\\_DEPENDENT\\_BY\\_GENERATED\\_COLUMN](#) was added in 5.7.6.

- Error: 3109 SQLSTATE: HY000 ([ER\\_GENERATED\\_COLUMN\\_REF\\_AUTO\\_INC](#))

Message: Generated column '%s' cannot refer to auto-increment column.

[ER\\_GENERATED\\_COLUMN\\_REF\\_AUTO\\_INC](#) was added in 5.7.6.

- Error: 3110 SQLSTATE: HY000 ([ER\\_FEATURE\\_NOT\\_AVAILABLE](#))

Message: The '%s' feature is not available; you need to remove '%s' or use MySQL built with '%s'

[ER\\_FEATURE\\_NOT\\_AVAILABLE](#) was added in 5.7.6.

- Error: 3111 SQLSTATE: HY000 ([ER\\_CANT\\_SET\\_GTID\\_MODE](#))

Message: SET @@GLOBAL.GTID\_MODE = %s is not allowed because %s.

[ER\\_CANT\\_SET\\_GTID\\_MODE](#) was added in 5.7.6.

- Error: 3112 SQLSTATE: HY000 ([ER\\_CANT\\_USE\\_AUTO\\_POSITION\\_WITH\\_GTID\\_MODE\\_OFF](#))

Message: The replication receiver thread%s cannot start in AUTO\_POSITION mode: this server uses @@GLOBAL.GTID\_MODE = OFF.

[ER\\_CANT\\_USE\\_AUTO\\_POSITION\\_WITH\\_GTID\\_MODE\\_OFF](#) was added in 5.7.6.

- Error: 3113 SQLSTATE: HY000 ([ER\\_CANT\\_REPLICATE\\_ANONYMOUS\\_WITH\\_AUTO\\_POSITION](#))

Message: Cannot replicate anonymous transaction when AUTO\_POSITION = 1, at file %s, position %lld.

`ER_CANT_REPLICATE_ANONYMOUS_WITH_AUTO_POSITION` was added in 5.7.6.

- Error: 3114 SQLSTATE: HY000 (`ER_CANT_REPLICATE_ANONYMOUS_WITH_GTID_MODE_ON`)

Message: Cannot replicate anonymous transaction when @@GLOBAL.GTID\_MODE = ON, at file %s, position %lld.

`ER_CANT_REPLICATE_ANONYMOUS_WITH_GTID_MODE_ON` was added in 5.7.6.

- Error: 3115 SQLSTATE: HY000 (`ER_CANT_REPLICATE_GTID_WITH_GTID_MODE_OFF`)

Message: Cannot replicate GTID-transaction when @@GLOBAL.GTID\_MODE = OFF, at file %s, position %lld.

`ER_CANT_REPLICATE_GTID_WITH_GTID_MODE_OFF` was added in 5.7.6.

- Error: 3116 SQLSTATE: HY000  
(`ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS`)

Message: Cannot set ENFORCE\_GTID\_CONSISTENCY = ON because there are ongoing transactions that violate GTID consistency.

`ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` is renamed to `ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX` in MySQL 8.0.

`ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was added in 5.7.6.

- Error: 3117 SQLSTATE: HY000  
(`ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS`)

Message: There are ongoing transactions that violate GTID consistency.

`ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` is renamed to `ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX` in MySQL 8.0.

`ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was added in 5.7.6.

- Error: 3118 SQLSTATE: HY000 (`ER_ACCOUNT_HAS_BEEN_LOCKED`)

Message: Access denied for user '%s'@'%s'. Account is locked.

The account was locked with `CREATE USER ... ACCOUNT LOCK` or `ALTER USER ... ACCOUNT LOCK`. An administrator can unlock it with `ALTER USER ... ACCOUNT UNLOCK`.

`ER_ACCOUNT_HAS_BEEN_LOCKED` was added in 5.7.6.

- Error: 3119 SQLSTATE: 42000 (`ER_WRONG_TABLESPACE_NAME`)

Message: Incorrect tablespace name '%s'

`ER_WRONG_TABLESPACE_NAME` was added in 5.7.6.

- Error: 3120 SQLSTATE: HY000 (`ER_TABLESPACE_IS_NOT_EMPTY`)

Message: Tablespace '%s' is not empty.

`ER_TABLESPACE_IS_NOT_EMPTY` was added in 5.7.6.

- Error: 3121 SQLSTATE: HY000 (ER\_WRONG\_FILE\_NAME)  
Message: Incorrect File Name '%s'.  
  
ER\_WRONG\_FILE\_NAME was added in 5.7.6.
- Error: 3122 SQLSTATE: HY000 (ER\_BOOST\_GEOMETRY\_INCONSISTENT\_TURNS\_EXCEPTION)  
Message: Inconsistent intersection points.  
  
ER\_BOOST\_GEOMETRY\_INCONSISTENT\_TURNS\_EXCEPTION was added in 5.7.7.
- Error: 3123 SQLSTATE: HY000 (ER\_WARN\_OPTIMIZER\_HINT\_SYNTAX\_ERROR)  
Message: Optimizer hint syntax error  
  
ER\_WARN\_OPTIMIZER\_HINT\_SYNTAX\_ERROR was added in 5.7.7.
- Error: 3124 SQLSTATE: HY000 (ER\_WARN\_BAD\_MAX\_EXECUTION\_TIME)  
Message: Unsupported MAX\_EXECUTION\_TIME  
  
ER\_WARN\_BAD\_MAX\_EXECUTION\_TIME was added in 5.7.7.
- Error: 3125 SQLSTATE: HY000 (ER\_WARN\_UNSUPPORTED\_MAX\_EXECUTION\_TIME)  
Message: MAX\_EXECUTION\_TIME hint is supported by top-level standalone SELECT statements only  
  
The MAX\_EXECUTION\_TIME( ) optimizer hint is supported only for SELECT statements.  
  
ER\_WARN\_UNSUPPORTED\_MAX\_EXECUTION\_TIME was added in 5.7.7.
- Error: 3126 SQLSTATE: HY000 (ER\_WARN\_CONFLICTING\_HINT)  
Message: Hint %s is ignored as conflicting/duplicated  
  
ER\_WARN\_CONFLICTING\_HINT was added in 5.7.7.
- Error: 3127 SQLSTATE: HY000 (ER\_WARN\_UNKNOWN\_QB\_NAME)  
Message: Query block name %s is not found for %s hint  
  
ER\_WARN\_UNKNOWN\_QB\_NAME was added in 5.7.7.
- Error: 3128 SQLSTATE: HY000 (ER\_UNRESOLVED\_HINT\_NAME)  
Message: Unresolved name %s for %s hint  
  
ER\_UNRESOLVED\_HINT\_NAME was added in 5.7.7.
- Error: 3129 SQLSTATE: HY000 (ER\_WARN\_DEPRECATED\_SQLMODE\_UNSET)  
Message: Unsetting sql mode '%s' is deprecated. It will be made read-only in a future release.  
  
ER\_WARN\_DEPRECATED\_SQLMODE\_UNSET was added in 5.7.7, removed after 5.7.7.
- Error: 3129 SQLSTATE: HY000 (ER\_WARN\_ON\_MODIFYING\_GTID\_EXECUTED\_TABLE)  
Message: Please do not modify the %s table. This is a mysql internal system table to store GTIDs for committed transactions. Modifying it can lead to an inconsistent GTID state.  
  
ER\_WARN\_ON\_MODIFYING\_GTID\_EXECUTED\_TABLE was added in 5.7.8.

- Error: 3130 SQLSTATE: HY000 (ER\_PLUGGABLE\_PROTOCOL\_COMMAND\_NOT\_SUPPORTED)  
Message: Command not supported by pluggable protocols  
  
[ER\\_PLUGGABLE\\_PROTOCOL\\_COMMAND\\_NOT\\_SUPPORTED](#) was added in 5.7.8.
- Error: 3131 SQLSTATE: 42000 (ER\_LOCKING\_SERVICE\_WRONG\_NAME)  
Message: Incorrect locking service lock name '%s'.  
  
A locking service name was specified as [NULL](#), the empty string, or a string longer than 64 characters. Namespace and lock names must be non-[NULL](#), nonempty, and no more than 64 characters long.  
  
[ER\\_LOCKING\\_SERVICE\\_WRONG\\_NAME](#) was added in 5.7.8.
- Error: 3132 SQLSTATE: HY000 (ER\_LOCKING\_SERVICE\_DEADLOCK)  
Message: Deadlock found when trying to get locking service lock; try releasing locks and restarting lock acquisition.  
  
[ER\\_LOCKING\\_SERVICE\\_DEADLOCK](#) was added in 5.7.8.
- Error: 3133 SQLSTATE: HY000 (ER\_LOCKING\_SERVICE\_TIMEOUT)  
Message: Service lock wait timeout exceeded.  
  
[ER\\_LOCKING\\_SERVICE\\_TIMEOUT](#) was added in 5.7.8.
- Error: 3134 SQLSTATE: HY000 (ER\_GIS\_MAX\_POINTS\_IN\_GEOMETRY\_OVERFLOWED)  
Message: Parameter %s exceeds the maximum number of points in a geometry (%lu) in function %s.  
  
[ER\\_GIS\\_MAX\\_POINTS\\_IN\\_GEOMETRY\\_OVERFLOWED](#) was added in 5.7.8.
- Error: 3135 SQLSTATE: HY000 (ER\_SQL\_MODE\_MERGED)  
Message: 'NO\_ZERO\_DATE', 'NO\_ZERO\_IN\_DATE' and 'ERROR\_FOR\_DIVISION\_BY\_ZERO' sql modes should be used with strict mode. They will be merged with strict mode in a future release.  
  
[ER\\_SQL\\_MODE\\_MERGED](#) was added in 5.7.8.
- Error: 3136 SQLSTATE: HY000 (ER\_VTOKEN\_PLUGIN\_TOKEN\_MISMATCH)  
Message: Version token mismatch for %.\*s. Correct value %.\*s  
  
The client has set its [version\\_tokens\\_session](#) system variable to the list of tokens it requires the server to match, but the server token list has at least one matching token name that has a value different from what the client requires. See [Section 6.5.6, “Version Tokens”](#).  
  
[ER\\_VTOKEN\\_PLUGIN\\_TOKEN\\_MISMATCH](#) was added in 5.7.8.
- Error: 3137 SQLSTATE: HY000 (ER\_VTOKEN\_PLUGIN\_TOKEN\_NOT\_FOUND)  
Message: Version token %.\*s not found.  
  
The client has set its [version\\_tokens\\_session](#) system variable to the list of tokens it requires the server to match, but the server token list is missing at least one of those tokens. See [Section 6.5.6, “Version Tokens”](#).  
  
[ER\\_VTOKEN\\_PLUGIN\\_TOKEN\\_NOT\\_FOUND](#) was added in 5.7.8.
- Error: 3138 SQLSTATE: HY000 (ER\_CANT\_SET\_VARIABLE\_WHEN\_OWNING\_GTID)

Message: Variable %s cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

[ER\\_CANT\\_SET\\_VARIABLE\\_WHEN\\_OWNING\\_GTID](#) was added in 5.7.8.

- Error: 3139 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_OPERATION\\_NOT\\_ALLOWED](#))

Message: %s cannot be performed on channel '%s'.

[ER\\_SLAVE\\_CHANNEL\\_OPERATION\\_NOT\\_ALLOWED](#) was added in 5.7.8.

- Error: 3140 SQLSTATE: 22032 ([ER\\_INVALID\\_JSON\\_TEXT](#))

Message: Invalid JSON text: "%s" at position %u in value for column '%s'.

[ER\\_INVALID\\_JSON\\_TEXT](#) was added in 5.7.8.

- Error: 3141 SQLSTATE: 22032 ([ER\\_INVALID\\_JSON\\_TEXT\\_IN\\_PARAM](#))

Message: Invalid JSON text in argument %u to function %s: "%s" at position %u.%s

[ER\\_INVALID\\_JSON\\_TEXT\\_IN\\_PARAM](#) was added in 5.7.8.

- Error: 3142 SQLSTATE: HY000 ([ER\\_INVALID\\_JSON\\_BINARY\\_DATA](#))

Message: The JSON binary value contains invalid data.

[ER\\_INVALID\\_JSON\\_BINARY\\_DATA](#) was added in 5.7.8.

- Error: 3143 SQLSTATE: 42000 ([ER\\_INVALID\\_JSON\\_PATH](#))

Message: Invalid JSON path expression. The error is around character position %u.%s

[ER\\_INVALID\\_JSON\\_PATH](#) was added in 5.7.8.

- Error: 3144 SQLSTATE: 22032 ([ER\\_INVALID\\_JSON\\_CHARSET](#))

Message: Cannot create a JSON value from a string with CHARACTER SET '%s'.

[ER\\_INVALID\\_JSON\\_CHARSET](#) was added in 5.7.8.

- Error: 3145 SQLSTATE: 22032 ([ER\\_INVALID\\_JSON\\_CHARSET\\_IN\\_FUNCTION](#))

Message: Invalid JSON character data provided to function %s: '%s'; utf8 is required.

[ER\\_INVALID\\_JSON\\_CHARSET\\_IN\\_FUNCTION](#) was added in 5.7.8.

- Error: 3146 SQLSTATE: 22032 ([ER\\_INVALID\\_TYPE\\_FOR\\_JSON](#))

Message: Invalid data type for JSON data in argument %u to function %s; a JSON string or JSON type is required.

[ER\\_INVALID\\_TYPE\\_FOR\\_JSON](#) was added in 5.7.8.

- Error: 3147 SQLSTATE: 22032 ([ER\\_INVALID\\_CAST\\_TO\\_JSON](#))

Message: Cannot CAST value to JSON.

[ER\\_INVALID\\_CAST\\_TO\\_JSON](#) was added in 5.7.8.

- Error: 3148 SQLSTATE: 42000 ([ER\\_INVALID\\_JSON\\_PATH\\_CHARSET](#))

Message: A path expression must be encoded in the utf8 character set. The path expression '%s' is encoded in character set '%s'.

[ER\\_INVALID\\_JSON\\_PATH\\_CHARSET](#) was added in 5.7.8.

- Error: 3149 SQLSTATE: 42000 ([ER\\_INVALID\\_JSON\\_PATH\\_WILDCARD](#))

Message: In this situation, path expressions may not contain the \* and \*\* tokens.

[ER\\_INVALID\\_JSON\\_PATH\\_WILDCARD](#) was added in 5.7.8.

- Error: 3150 SQLSTATE: 22032 ([ER\\_JSON\\_VALUE\\_TOO\\_BIG](#))

Message: The JSON value is too big to be stored in a JSON column.

[ER\\_JSON\\_VALUE\\_TOO\\_BIG](#) was added in 5.7.8.

- Error: 3151 SQLSTATE: 22032 ([ER\\_JSON\\_KEY\\_TOO\\_BIG](#))

Message: The JSON object contains a key name that is too long.

[ER\\_JSON\\_KEY\\_TOO\\_BIG](#) was added in 5.7.8.

- Error: 3152 SQLSTATE: 42000 ([ER\\_JSON\\_USED\\_AS\\_KEY](#))

Message: JSON column '%s' cannot be used in key specification.

[ER\\_JSON\\_USED\\_AS\\_KEY](#) was added in 5.7.8.

- Error: 3153 SQLSTATE: 42000 ([ER\\_JSON\\_VACUOUS\\_PATH](#))

Message: The path expression '\$' is not allowed in this context.

[ER\\_JSON\\_VACUOUS\\_PATH](#) was added in 5.7.8.

- Error: 3154 SQLSTATE: 42000 ([ER\\_JSON\\_BAD\\_ONE\\_OR\\_ALL\\_ARG](#))

Message: The oneOrAll argument to %s may take these values: 'one' or 'all'.

[ER\\_JSON\\_BAD\\_ONE\\_OR\\_ALL\\_ARG](#) was added in 5.7.8.

- Error: 3155 SQLSTATE: 22003 ([ER\\_NUMERIC\\_JSON\\_VALUE\\_OUT\\_OF\\_RANGE](#))

Message: Out of range JSON value for CAST to %s%s from column %s at row %ld

[ER\\_NUMERIC\\_JSON\\_VALUE\\_OUT\\_OF\\_RANGE](#) was added in 5.7.8.

- Error: 3156 SQLSTATE: 22018 ([ER\\_INVALID\\_JSON\\_VALUE\\_FOR\\_CAST](#))

Message: Invalid JSON value for CAST to %s%s from column %s at row %ld

[ER\\_INVALID\\_JSON\\_VALUE\\_FOR\\_CAST](#) was added in 5.7.8.

- Error: 3157 SQLSTATE: 22032 ([ER\\_JSON\\_DOCUMENT\\_TOO\\_DEEP](#))

Message: The JSON document exceeds the maximum depth.

[ER\\_JSON\\_DOCUMENT\\_TOO\\_DEEP](#) was added in 5.7.8.

- Error: 3158 SQLSTATE: 22032 ([ER\\_JSON\\_DOCUMENT\\_NULL\\_KEY](#))

Message: JSON documents may not contain NULL member names.

[ER\\_JSON\\_DOCUMENT\\_NULL\\_KEY](#) was added in 5.7.8.

- Error: 3159 SQLSTATE: HY000 (ER\_SECURE\_TRANSPORT\_REQUIRED)

Message: Connections using insecure transport are prohibited while --require\_secure\_transport=ON.

With the `require_secure_transport` system variable, clients can connect only using secure transports. Qualifying connections are those using SSL, a Unix socket file, or shared memory.

`ER_SECURE_TRANSPORT_REQUIRED` was added in 5.7.8.

- Error: 3160 SQLSTATE: HY000 (ER\_NO\_SECURE\_TRANSPORTS\_CONFIGURED)

Message: No secure transports (SSL or Shared Memory) are configured, unable to set --require\_secure\_transport=ON.

The `require_secure_transport` system variable cannot be enabled if the server does not support at least one secure transport. Configure the server with the required SSL keys/certificates to enable SSL connections, or enable the `shared_memory` system variable to enable shared-memory connections.

`ER_NO_SECURE_TRANSPORTS_CONFIGURED` was added in 5.7.8.

- Error: 3161 SQLSTATE: HY000 (ER\_DISABLED\_STORAGE\_ENGINE)

Message: Storage engine %s is disabled (Table creation is disallowed).

An attempt was made to create a table or tablespace using a storage engine listed in the value of the `disabled_storage_engines` system variable, or to change an existing table or tablespace to such an engine. Choose a different storage engine.

`ER_DISABLED_STORAGE_ENGINE` was added in 5.7.8.

- Error: 3162 SQLSTATE: HY000 (ER\_USER\_DOES\_NOT\_EXIST)

Message: User %s does not exist.

`ER_USER_DOES_NOT_EXIST` was added in 5.7.8.

- Error: 3163 SQLSTATE: HY000 (ER\_USER\_ALREADY\_EXISTS)

Message: User %s already exists.

`ER_USER_ALREADY_EXISTS` was added in 5.7.8.

- Error: 3164 SQLSTATE: HY000 (ER\_AUDIT\_API\_ABORT)

Message: Aborted by Audit API ('%s';%d).

This error indicates that an audit plugin terminated execution of an event. The message typically indicates the event subclass name and a numeric status value.

`ER_AUDIT_API_ABORT` was added in 5.7.8.

- Error: 3165 SQLSTATE: 42000 (ER\_INVALID\_JSON\_PATH\_ARRAY\_CELL)

Message: A path expression is not a path to a cell in an array.

`ER_INVALID_JSON_PATH_ARRAY_CELL` was added in 5.7.8.

- Error: 3166 SQLSTATE: HY000 (ER\_BUFPOOL\_RESIZE\_INPROGRESS)

Message: Another buffer pool resize is already in progress.

`ER_BUFPOOL_RESIZE_INPROGRESS` was added in 5.7.9.

- Error: 3167 SQLSTATE: HY000 (ER\_FEATURE\_DISABLED\_SEE\_DOC)  
Message: The '%s' feature is disabled; see the documentation for '%s'  
[ER\\_FEATURE\\_DISABLED\\_SEE\\_DOC](#) was added in 5.7.9.
- Error: 3168 SQLSTATE: HY000 (ER\_SERVER\_ISNT\_AVAILABLE)  
Message: Server isn't available  
[ER\\_SERVER\\_ISNT\\_AVAILABLE](#) was added in 5.7.9.
- Error: 3169 SQLSTATE: HY000 (ER\_SESSION\_WAS\_KILLED)  
Message: Session was killed  
[ER\\_SESSION\\_WAS\\_KILLED](#) was added in 5.7.9.
- Error: 3170 SQLSTATE: HY000 (ER\_CAPACITY\_EXCEEDED)  
Message: Memory capacity of %llu bytes for '%s' exceeded. %s  
[ER\\_CAPACITY\\_EXCEEDED](#) was added in 5.7.9.
- Error: 3171 SQLSTATE: HY000 (ER\_CAPACITY\_EXCEEDED\_IN\_RANGE\_OPTIMIZER)  
Message: Range optimization was not done for this query.  
[ER\\_CAPACITY\\_EXCEEDED\\_IN\\_RANGE\\_OPTIMIZER](#) was added in 5.7.9.
- Error: 3172 SQLSTATE: HY000 (ER\_TABLE\_NEEDS\_UPG\_PART)  
Message: Partitioning upgrade required. Please dump/reload to fix it or do: ALTER TABLE `%s`.`%s` UPGRADE PARTITIONING  
[ER\\_TABLE\\_NEEDS\\_UPG\\_PART](#) was added in 5.7.9.
- Error: 3173 SQLSTATE: HY000  
([ER\\_CANT\\_WAIT\\_FOR\\_EXECUTED\\_GTID\\_SET\\_WHILE\\_OWNING\\_A\\_GTID](#))  
Message: The client holds ownership of the GTID %s. Therefore, WAIT\_FOR\_EXECUTED\_GTID\_SET cannot wait for this GTID.  
[ER\\_CANT\\_WAIT\\_FOR\\_EXECUTED\\_GTID\\_SET\\_WHILE\\_OWNING\\_A\\_GTID](#) was added in 5.7.9.
- Error: 3174 SQLSTATE: HY000 (ER\_CANNOT\_ADD\_FOREIGN\_BASE\_COL\_VIRTUAL)  
Message: Cannot add foreign key on the base column of indexed virtual column.  
[ER\\_CANNOT\\_ADD\\_FOREIGN\\_BASE\\_COL\\_VIRTUAL](#) was added in 5.7.10.
- Error: 3175 SQLSTATE: HY000 (ER\_CANNOT\_CREATE\_VIRTUAL\_INDEX\_CONSTRAINT)  
Message: Cannot create index on virtual column whose base column has foreign constraint.  
[ER\\_CANNOT\\_CREATE\\_VIRTUAL\\_INDEX\\_CONSTRAINT](#) was added in 5.7.10.
- Error: 3176 SQLSTATE: HY000 (ER\_ERROR\_ON\_MODIFYING\_GTID\_EXECUTED\_TABLE)  
Message: Please do not modify the %s table with an XA transaction. This is an internal system table used to store GTIDs for committed transactions. Although modifying it can lead to an inconsistent GTID state, if necessary you can modify it with a non-XA transaction.  
[ER\\_ERROR\\_ON\\_MODIFYING\\_GTID\\_EXECUTED\\_TABLE](#) was added in 5.7.11.

- Error: 3177 SQLSTATE: HY000 (ER\_LOCK\_REFUSED\_BY\_ENGINE)  
Message: Lock acquisition refused by storage engine.  
[ER\\_LOCK\\_REFUSED\\_BY\\_ENGINE](#) was added in 5.7.11.
- Error: 3178 SQLSTATE: HY000 (ER\_UNSUPPORTED\_ALTER\_ONLINE\_ON\_VIRTUAL\_COLUMN)  
Message: ADD COLUMN col...VIRTUAL, ADD INDEX(col)  
[ER\\_UNSUPPORTED\\_ALTER\\_ONLINE\\_ON\\_VIRTUAL\\_COLUMN](#) was added in 5.7.11.
- Error: 3179 SQLSTATE: HY000 (ER\_MASTER\_KEY\_ROTATION\_NOT\_SUPPORTED\_BY\_SE)  
Message: Master key rotation is not supported by storage engine.  
[ER\\_MASTER\\_KEY\\_ROTATION\\_NOT\\_SUPPORTED\\_BY\\_SE](#) was added in 5.7.11.
- Error: 3180 SQLSTATE: HY000 (ER\_MASTER\_KEY\_ROTATION\_ERROR\_BY\_SE)  
Message: Encryption key rotation error reported by SE: %s  
[ER\\_MASTER\\_KEY\\_ROTATION\\_ERROR\\_BY\\_SE](#) was added in 5.7.11.
- Error: 3181 SQLSTATE: HY000 (ER\_MASTER\_KEY\_ROTATION\_BINLOG\_FAILED)  
Message: Write to binlog failed. However, master key rotation has been completed successfully.  
[ER\\_MASTER\\_KEY\\_ROTATION\\_BINLOG\\_FAILED](#) was added in 5.7.11.
- Error: 3182 SQLSTATE: HY000 (ER\_MASTER\_KEY\_ROTATION\_SE\_UNAVAILABLE)  
Message: Storage engine is not available.  
[ER\\_MASTER\\_KEY\\_ROTATION\\_SE\\_UNAVAILABLE](#) was added in 5.7.11.
- Error: 3183 SQLSTATE: HY000 (ER\_TABLESPACE\_CANNOT\_ENCRYPT)  
Message: This tablespace can't be encrypted.  
[ER\\_TABLESPACE\\_CANNOT\\_ENCRYPT](#) was added in 5.7.11.
- Error: 3184 SQLSTATE: HY000 (ER\_INVALID\_ENCRYPTION\_OPTION)  
Message: Invalid encryption option.  
[ER\\_INVALID\\_ENCRYPTION\\_OPTION](#) was added in 5.7.11.
- Error: 3185 SQLSTATE: HY000 (ER\_CANNOT\_FIND\_KEY\_IN\_KEYRING)  
Message: Can't find master key from keyring, please check keyring plugin is loaded.  
[ER\\_CANNOT\\_FIND\\_KEY\\_IN\\_KEYRING](#) was added in 5.7.11.
- Error: 3186 SQLSTATE: HY000 (ER\_CAPACITY\_EXCEEDED\_IN\_PARSER)  
Message: Parser bailed out for this query.  
[ER\\_CAPACITY\\_EXCEEDED\\_IN\\_PARSER](#) was added in 5.7.12.
- Error: 3187 SQLSTATE: HY000 (ER\_UNSUPPORTED\_ALTER\_ENCRYPTION\_INPLACE)  
Message: Cannot alter encryption attribute by inplace algorithm.  
[ER\\_UNSUPPORTED\\_ALTER\\_ENCRYPTION\\_INPLACE](#) was added in 5.7.13.

- Error: 3188 SQLSTATE: HY000 ([ER\\_KEYRING\\_UDF\\_KEYRING\\_SERVICE\\_ERROR](#))

Message: Function '%s' failed because underlying keyring service returned an error. Please check if a keyring plugin is installed and that provided arguments are valid for the keyring you are using.

[ER\\_KEYRING\\_UDF\\_KEYRING\\_SERVICE\\_ERROR](#) was added in 5.7.13.

- Error: 3189 SQLSTATE: HY000 ([ER\\_USER\\_COLUMN\\_OLD\\_LENGTH](#))

Message: It seems that your db schema is old. The %s column is 77 characters long and should be 93 characters long. Please run mysql\_upgrade.

[ER\\_USER\\_COLUMN\\_OLD\\_LENGTH](#) was added in 5.7.13.

- Error: 3190 SQLSTATE: HY000 ([ER\\_CANT\\_RESET\\_MASTER](#))

Message: RESET MASTER is not allowed because %s.

[ER\\_CANT\\_RESET\\_MASTER](#) was added in 5.7.14.

- Error: 3191 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_MAX\\_GROUP\\_SIZE](#))

Message: The START GROUP\_REPLICATION command failed since the group already has 9 members.

[ER\\_GROUP\\_REPLICATION\\_MAX\\_GROUP\\_SIZE](#) was added in 5.7.14.

- Error: 3192 SQLSTATE: HY000 ([ER\\_CANNOT\\_ADD\\_FOREIGN\\_BASE\\_COL\\_STORED](#))

Message: Cannot add foreign key on the base column of stored column.

[ER\\_CANNOT\\_ADD\\_FOREIGN\\_BASE\\_COL\\_STORED](#) was added in 5.7.14.

- Error: 3193 SQLSTATE: HY000 ([ER\\_TABLE\\_REFERENCED](#))

Message: Cannot complete the operation because table is referenced by another connection.

[ER\\_TABLE\\_REFERENCED](#) was added in 5.7.14.

- Error: 3194 SQLSTATE: HY000 ([ER\\_PARTITION\\_ENGINE\\_DEPRECATED\\_FOR\\_TABLE](#))

Message: The partition engine, used by table '%s.%s', is deprecated and will be removed in a future release. Please use native partitioning instead.

[ER\\_PARTITION\\_ENGINE\\_DEPRECATED\\_FOR\\_TABLE](#) was added in 5.7.17.

## B.4 Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the [include/errmsg.h](#) MySQL source file.
- The Message values correspond to the error messages that are listed in the [libmysql/errmsg.c](#) file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 2000 ([CR\\_UNKNOWN\\_ERROR](#))

Message: Unknown MySQL error

- Error: 2001 (CR\_SOCKET\_CREATE\_ERROR)  
Message: Can't create UNIX socket (%d)
- Error: 2002 (CR\_CONNECTION\_ERROR)  
Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error: 2003 (CR\_CONN\_HOST\_ERROR)  
Message: Can't connect to MySQL server on '%s' (%d)
- Error: 2004 (CR\_IPSOCK\_ERROR)  
Message: Can't create TCP/IP socket (%d)
- Error: 2005 (CR\_UNKNOWN\_HOST)  
Message: Unknown MySQL server host '%s' (%d)

An insecure function call was detected. Modify the application to use the suggested alternative function instead.

[CR\\_INSECURE\\_API\\_ERR](#) was added in 5.7.6.

## B.5 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

### B.5.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as [glibc](#)) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 6.4, "MySQL Server Logs"](#).
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.

- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.7, “How to Report Bugs or Problems”](#).

## B.5.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### B.5.2.1 Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 7.2, “The MySQL Access Privilege System”](#), and [Section 7.2.7, “Troubleshooting Problems Connecting to MySQL”](#).

### B.5.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when

trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2, "Starting the Server"](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Connection to MySQL Server Failing on Windows](#).
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.5.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket`

option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.5.3.6, “How to Protect or Change the MySQL Unix Socket File”](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See [Section B.5.3.3, “What to Do If MySQL Keeps Crashing”](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

## Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

#### Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### B.5.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem

by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see an `ER_NET_PACKET_TOO_LARGE` error, and that confirms that you need to increase `max_allowed_packet`.

#### B.5.2.4 Client does not support authentication protocol

##### Note

The information in this section applies only before MySQL 5.7.5. Support for pre-4.1 password hashes is removed in MySQL 5.7.5. This includes removal of the `mysql_old_password` authentication plugin and the `OLD_PASSWORD()` function. Also, `secure_auth` cannot be disabled, and `old_passwords` cannot be set to 1.

The current implementation of the authentication protocol uses a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. Attempts to connect to a 4.1 or higher server with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To deal with this problem, the preferred solution is to upgrade all client programs to use a 4.1.1 or higher client library. If that is not possible, use one of the following approaches:

- To connect to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function. It is also necessary to first ensure that the authentication plugin for the account is `mysql_old_password`:

```
mysql> UPDATE mysql.user SET plugin = 'mysql_old_password'
mysql> WHERE User = 'some_user' AND Host = 'some_host';
mysql> FLUSH PRIVILEGES;
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('new_password');
```

Substitute the password you want to use for “`new_password`” in the preceding example. MySQL cannot tell you what the original password was, so you need to pick a new one.

- Tell the server to use the older password hashing algorithm by default:
  1. Start `mysqld` with the `old_passwords` system variable set to 1.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using one of the methods described previously.

The `Client does not support authentication protocol` error also can occur if multiple versions of MySQL are installed but client programs are dynamically linked and link to an older library. Make sure that clients use the most recent library version with which they are compatible. The procedure to do this will depend on your system.

**Note**

The PHP `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or higher, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for "MySQL, Improved"; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

For additional background on password hashing and authentication, see [Section 7.1.2.4, "Password Hashing in MySQL"](#).

### B.5.2.5 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

### B.5.2.6 Host 'host\_name' is blocked

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the `max_connect_errors` system variable determines how many successive interrupted connection requests are permitted. (See [Section 6.1.5, "Server System Variables"](#).) After `max_connect_errors` failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you issue a `FLUSH HOSTS` statement or execute a `mysqladmin flush-hosts` command.

By default, `mysqld` blocks a host after 100 connection errors. You can adjust the value by setting `max_connect_errors` at server startup:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

The value can also be set at runtime:

```
mysql> SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

### B.5.2.7 Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

`mysqld` actually permits `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 14.7.5.29, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL supports depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at least 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target undemanding. Windows is limited to  $(\text{open tables} \times 2 + \text{open connections}) < 2048$  due to the Posix compatibility layer used on that platform.

Increasing `open-files-limit` may be necessary. Also see [Section 2.5, “Installing MySQL on Linux”](#), for how to raise the operating system limit on how many handles can be used by MySQL.

### B.5.2.8 Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

### B.5.2.9 MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

| Error Code                        | Description   |
|-----------------------------------|---|
| <code>CR_SERVER_GONE_ERROR</code> | The client couldn't send a question to the server.  |
| <code>CR_SERVER_LOST</code>       | The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question. |

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 6.1.5, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 4MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.5.2.10, “Packet Too Large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.5.3.3, "What to Do If MySQL Keeps Crashing"](#).

You can get more information about the lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See [Section 6.4.2, "The Error Log"](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.5.3.3, "What to Do If MySQL Keeps Crashing"](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section 27.5, "Debugging and Porting MySQL"](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 6.4.3, "The General Query Log"](#).)

See also [Section B.5.2.11, "Communication Errors and Aborted Connections"](#), and [Section 1.7, "How to Report Bugs or Problems"](#).

### B.5.2.10 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.7 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 4MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

### B.5.2.11 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See [Section 6.4.2, “The Error Log”](#).
- The general query log. See [Section 6.4.3, “The General Query Log”](#).
- The `Aborted_xxx` and `Connection_errors_xxx` status variables. See [Section 6.1.7, “Server Status Variables”](#).
- The host cache, which is accessible using the `host_cache` Performance Schema table. See [Section 9.12.5.2, “DNS Lookup Optimization and the Host Cache”](#), and [Section 24.10.16.1, “The host\\_cache Table”](#).

If you start the server with the `log_error_verbosity` system variable set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to obtain a connect packet. See [Section 6.1.5, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 6.1.5, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.5.2.10, “Packet Too Large”](#).
- Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also [Section B.5.2.9, “MySQL server has gone away”](#).

### B.5.2.12 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See [Section C.10.3, “Limits on Table Size”](#).

### B.5.2.13 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '...\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 5.2.6, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the file system is full:

```
shell> pererror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.5.2.14 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.5.2.15 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. Check whether the `Password` column of that table is shorter than 16 characters. If so, correct this condition by running `mysql_upgrade`.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('new_password')
-> WHERE User='some_user' AND Host='some_host';
```

### B.5.2.16 Table 'tbl\_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 14.7.5, “SHOW Syntax”](#).

### B.5.2.17 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` or `-DWITH_EXTRA_CHARSETS=charset_name` option. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

All standard MySQL binaries are compiled with `-DWITH_EXTRA_CHARSETS=complex`, which enables support for all multibyte character sets. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

### B.5.2.18 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23), Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in [Section 9.4.3.1, “How MySQL Opens and Closes Tables”](#). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 6.1.5, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 5.2.6, “Using Option Files”](#). If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

#### Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

### B.5.2.19 Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also [Section 6.1.4, “Server Command Options”](#), and [Section 27.5.1.7, “Making a Test Case If You Experience Table Corruption”](#).

## B.5.3 Administration-Related Issues

### B.5.3.1 Problems with File Permissions

If you have problems with file permissions, the `UMASK` or `UMASK_DIR` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` and `UMASK_DIR` values are `0640` and `0750`, respectively (`0660` and `0700` prior to MySQL 5.7.6). MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because `0600` octal is `384` decimal.

To change the default `UMASK` value, start `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0750`. To modify this behavior, set the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, to give group access to all new directories, start `mysqld_safe` as follows:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

For additional details, see [Section 5.9, “MySQL Program Environment Variables”](#).

### B.5.3.2 How to Reset the Root Password

If you have never assigned a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning a password, see [Section 2.10.4, “Securing the Initial MySQL Accounts”](#).

If you know the `root` password and want to change it, see [Section 14.7.1.1, “ALTER USER Syntax”](#), and [Section 14.7.1.7, “SET PASSWORD Syntax”](#).

If you assigned a `root` password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

#### Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

MySQL 5.7.6 and later:

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

MySQL 5.7.5 and earlier:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPass');
```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.
6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 5.7\bin"
C:\> mysqld --init-file=C:\mysql-init.txt
```

If you installed MySQL to a different location, adjust the `cd` command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing the `'root'@'localhost'` account password.

To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

```
C:\> mysqld
--defaults-file="C:\ProgramData\MySQL\MySQL Server 5.7\my.ini"
--init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list, right-click it, and choose the **Properties** option. The **Path to executable** field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
UPDATE mysql.user
  SET authentication_string = PASSWORD('MyNewPass'), password_expired = 'N'
  WHERE User = 'root' AND Host = 'localhost';
FLUSH PRIVILEGES;
```

## Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

The instructions assume that you will start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).
2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

MySQL 5.7.6 and later:

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

MySQL 5.7.5 and earlier:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPass');
```

4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.
5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing the `'root'@'localhost'` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
UPDATE mysql.user
  SET authentication_string = PASSWORD('MyNewPass'), password_expired = 'N'
  WHERE User = 'root' AND Host = 'localhost';
FLUSH PRIVILEGES;
```

## Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, you might want to use `--skip-grant-tables` in conjunction with `--skip-networking` to prevent remote clients from connecting.
2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
shell> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `'root'@'localhost'` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

MySQL 5.7.6 and later:

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

MySQL 5.7.5 and earlier:

```
mysql> SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPass');
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` and `--skip-networking` options).

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
UPDATE mysql.user SET authentication_string = PASSWORD('MyNewPass')
WHERE User = 'root' AND Host = 'localhost';
FLUSH PRIVILEGES;
```

### B.5.3.3 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 6.4.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [Section 27.5, “Debugging and Porting MySQL”](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 6, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 6.4.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 6.4.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See [Section 1.7, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [Section 27.5, “Debugging and Porting MySQL”](#).
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See [Section 27.5, “Debugging and Porting MySQL”](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- If `mysqld` appears to be running but not responding, try `mysqladmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [Section 27.5, “Debugging and Porting MySQL”](#).
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.7, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, the crash might result from something

that exists only on your computer (for example, an error that is related to your particular system libraries).

- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

### B.5.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

### B.5.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `mysqld --tmpdir` option to specify a directory in a file system where you have enough space. On replication slaves, you can use `--slave-load-tmpdir` to specify a separate directory for holding temporary files when replicating `LOAD DATA INFILE` statements.

The `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows.

#### Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should be sure to set `--slave-load-tmpdir` not to point to a directory that is on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the slave temporary file directory are lost when the server restarts, replication fails.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, `ls -l` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

In most cases, `ALTER TABLE` creates a temporary copy of the original table in the same directory as the original table.

## Where InnoDB Stores Temporary Files

As of MySQL 5.7.1, non-compressed `InnoDB` temporary tables are stored in a temporary tablespace file named `ibtmp1`, which is located in the MySQL `data` directory (`datadir`) by default. The `innodb_temp_data_file_path` option can be used at startup to specify a different file name and location. Compressed `InnoDB` temporary tables are stored in their own independent tablespace files (`.ibd` files) in the path specified by the `TMPDIR` environment variable.

If an `ALTER TABLE` operation on an `InnoDB` table uses the `ALGORITHM=COPY` technique, `InnoDB` creates a temporary copy of the table in the same directory as the original table. Temporary table file names begin with an `#sql-` prefix and only appear briefly during the `ALTER TABLE` operation.

If an `ALTER TABLE` operation rebuilds an `InnoDB` table using the `ALGORITHM=INPLACE` technique (online DDL), `InnoDB` creates an *intermediate* copy of the table in the same directory as the original table. Intermediate table file names begin with an `#sql-ib` prefix and only appear briefly during the `ALTER TABLE` operation.

`ALTER TABLE` operations that rebuild an `InnoDB` table using the `ALGORITHM=INPLACE` technique (online DDL) also create temporary sort files in the MySQL temporary directory (`$TMPDIR` on Unix, `%TEMP%` on Windows, or the directory specified by the `--tmpdir` configuration option). If the

temporary directory is not large enough to hold such files, you may need to reconfigure `tmpdir`. Alternatively, you can define a separate temporary directory for InnoDB online `ALTER TABLE` operations using the `innodb_tmpdir` configuration option. This option was introduced in MySQL 5.7.11 to help avoid temporary directory overflows that could occur as a result of large temporary sort files created during online `ALTER TABLE` operations. `innodb_tmpdir` can be configured dynamically using a `SET GLOBAL` or `SET SESSION` statement.

The `innodb_tmpdir` option is not applicable to intermediate table files, which are always created in the same directory as the original table.

In replication environments, only consider replicating an `innodb_tmpdir` setting if all servers have the same operating system environment. Otherwise, replicating an `innodb_tmpdir` setting could result in a replication failure when running online `ALTER TABLE` operations. If server operating environments differ, it is recommended that you configure `innodb_tmpdir` on each server individually.

For more information about online DDL, [Section 15.13, “InnoDB and Online DDL”](#).

### B.5.3.6 How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 5.2.6, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

### B.5.3.7 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Section 5.9, “MySQL Program Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

## B.5.4 Query-Related Issues

### B.5.4.1 Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character’s “sort value.” Characters with the same sort value are treated as the same character. For example, if `e` and `é` have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a %'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 14.1.18, “CREATE TABLE Syntax”](#).

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
->      @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
|          0 |
+-----+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-----+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-----+
```

```
| 1 |
+-----+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
| 0 |
+-----+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-----+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-----+
| 1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-----+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-----+
| binary | binary |
+-----+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See [Section 13.5, “String Functions”](#).

### B.5.4.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster

comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` mode.

MySQL permits you to store a “zero” value of `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores `'0000-00-00'`. To disallow `'0000-00-00'`, enable the `NO_ZERO_DATE` mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

### B.5.4.3 Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 4.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. To load a `NULL` value into a column, use `\N` in the data file. The literal word `NULL` may also be used under some circumstances. See [Section 14.2.6, “LOAD DATA INFILE Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

### B.5.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
  WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY 'a';
```

### B.5.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
```

```
SHOW CREATE TABLE tbl_name;
```

See [Section 14.7.5.36, “SHOW TABLE STATUS Syntax”](#), and [Section 14.7.5.10, “SHOW CREATE TABLE Syntax”](#).

To check which storage engines your `mysqld` server supports, use this statement:

```
SHOW ENGINES;
```

See [Section 14.7.5.16, “SHOW ENGINES Syntax”](#) for full details.

### B.5.4.6 Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

### B.5.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 14.8.2, “EXPLAIN Syntax”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you cannot use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.5.4.8, “Problems with Floating-Point Values”](#).
6. If you still cannot figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

### B.5.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE`

data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);
```

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

| i | a     | b    |
|---|-------|------|
| 1 | 21.4  | 21.4 |
| 2 | 76.8  | 76.8 |
| 3 | 7.4   | 7.4  |
| 4 | 15.4  | 15.4 |
| 5 | 7.2   | 7.2  |
| 6 | -51.4 | 0    |

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

| i | a     | b |
|---|-------|---|
| 6 | -51.4 | 0 |

1 row in set (0.00 sec)

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
```

| i | a    | b    |
|---|------|------|
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4  | 7.4  |
| 4 | 15.4 | 15.4 |
| 5 | 7.2  | 7.2  |

```
+-----+-----+-----+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52', '-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

## B.5.5 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 14.8.2, “EXPLAIN Syntax”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 14.7.2.1, “ANALYZE TABLE Syntax”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 9.9.4, “Index Hints”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 14.2.9, “SELECT Syntax”](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 6.1.5, “Server System Variables”](#).

## B.5.6 Table Definition-Related Issues

### B.5.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table. `REPAIR TABLE` works for `MyISAM`, `ARCHIVE`, and `CSV` tables.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

### B.5.6.2 TEMPORARY Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 18.4.1, “Replication Features and Issues”](#), for more information.
- Temporary tables created outside stored functions and referred to across multiple calling and callee functions might result in this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

## B.5.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.1, “General Installation Guidance”](#), and [Section 27.5, “Debugging and Porting MySQL”](#).

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- With statement-based binary logging, the master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT, INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.**

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=old_host_name-bin`. See [Section 6.1.4, “Server Command Options”](#). Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a slave server.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See [Section 5.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- You cannot use `_` or `%` with `ESCAPE` in `LIKE ... ESCAPE`.
- The server uses only the first `max_sort_length` bytes when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY`, or `DISTINCT` if they differ only after the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, not 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;  
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads  
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

---

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

### C.1 Restrictions on Stored Programs

These restrictions apply to the features described in [Chapter 22, \*Stored Programs and Views\*](#).

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some [restrictions specific to stored functions](#) but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some [restrictions specific to triggers](#).

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some [restrictions specific to events](#).

### SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- Generally, statements not permitted in SQL prepared statements are also not permitted in stored programs. For a list of statements supported as prepared statements, see [Section 14.5, “Prepared SQL Statement Syntax”](#). Exceptions are `SIGNAL`, `RESIGNAL`, and `GET DIAGNOSTICS`, which are not permissible as prepared statements but are permitted in stored programs.
- Because local variables are in scope only during stored program execution, references to them are not permitted in prepared statements created within a stored program. Prepared statement

scope is the current session, not the stored program, so the statement could be executed after the program ends, at which point the variables would no longer be in scope. For example, `SELECT ... INTO local_var` cannot be used as a prepared statement. This restriction also applies to stored procedure and function parameters. See [Section 14.5.1, “PREPARE Syntax”](#).

- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

## Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 14.2.9.1, “SELECT ... INTO Syntax”](#), and [Section 14.6.6, “Cursors”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- `HANDLER ... READ` statements that invoke stored functions can cause replication errors and are disallowed.

## Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see [Section 18.4.1.35, “Replication and Triggers”](#).
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

## Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

## Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in [Section 22.7, “Binary Logging of Stored Programs”](#).

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

## Debugging Considerations

There are no stored routine debugging facilities.

## Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers
- `FOR` loops

## Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See [Section 22.7, “Binary Logging of Stored Programs”](#).

## Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug #16409, Bug #18896)
- DDL statements on events are prohibited while a `LOCK TABLES` statement is in effect.
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug #16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts are updated in the global scope. (Bug #16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug #16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See Bug #22830 for more information.)

**Stored routines and triggers in MySQL Cluster.** Stored procedures, stored functions, and triggers are all supported by tables using the `NDB` storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the `mysql` system database using the `MyISAM` storage engine, and so do not participate in clustering.
- The `.TRN` and `.TRG` files containing trigger definitions are not read by the `NDB` storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

### Warning

Do *not* attempt to work around the issue described in the first item mentioned previously by converting any `mysql` database tables to use the `NDB` storage engine. *Altering the system tables in the `mysql` database is not supported* and is very likely to produce undesirable results.

## C.2 Restrictions on Condition Handling

`SIGNAL`, `RESIGNAL`, and `GET DIAGNOSTICS` are not permissible as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

`SQLSTATE` values in class '04' are not treated specially. They are handled the same as other exceptions.

Standard SQL has a diagnostics area stack, containing a diagnostics area for each nested execution context. Standard SQL syntax includes `GET STACKED DIAGNOSTICS` for referring to stacked areas. MySQL does not support the `STACKED` keyword because there is a single diagnostics area containing information from the most recent statement that wrote to it. See also [Section 14.6.7.7, “The MySQL Diagnostics Area”](#).

In standard SQL, the first condition relates to the `SQLSTATE` value returned for the previous SQL statement. In MySQL, this is not guaranteed, so to get the main error, you cannot do this:

```
GET DIAGNOSTICS CONDITION 1 @errno = MYSQL_ERRNO;
```

Instead, do this:

```
GET DIAGNOSTICS @cno = NUMBER;
GET DIAGNOSTICS CONDITION @cno @errno = MYSQL_ERRNO;
```

## C.3 Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into an internal temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table when its size exceeds the minimum value of the `max_heap_table_size` and `tmp_table_size` system variables. The same restrictions apply to internal temporary tables created to hold the result set for a cursor as for other uses of internal temporary tables. See [Section 9.4.4, “Internal Temporary Table Use in MySQL”](#). One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

## C.4 Restrictions on Subqueries

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
```

```
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause and that subquery is materialized rather than merged into the outer query. (See [Optimizing Derived Tables and View References](#).) Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```

Here the result from the subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
  - For `expr [NOT] IN subquery`, `expr` can be an *n*-tuple (specified using row constructor syntax) and the subquery can return rows of *n*-tuples. The permitted syntax is therefore more specifically expressed as `row_constructor [NOT] IN table_subquery`
  - For `expr op {ALL|ANY|SOME} subquery`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of *n*-tuples, this is supported:

```
(expr_1, ..., expr_n) [NOT] IN table_subquery
```

But this is not supported:

```
(expr_1, ..., expr_n) op {ALL|ANY|SOME} subquery
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized in whole (evaluated to produce a result set) during query execution, so they cannot be evaluated per row of the outer query. The optimizer delays materialization until the result is needed, which may permit materialization to be avoided. See [Optimizing Derived Tables and View References](#).
- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
-> WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support
'LIMIT & IN/ALL/ANY/SOME subquery'
```

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is an extension to the SQL standard. In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

## C.5 Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Before MySQL 5.7.7, subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section C.4, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist. For details, see [Section 22.5.3, “Updatable and Insertable Views”](#).

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug #22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded

without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

## C.6 Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA,” storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

Prior to MySQL 5.7.7, XA transactions were not compatible with replication. This was because an XA transaction that was in `PREPARED` state would be rolled back on clean server shutdown or client disconnect. Similarly, an XA transaction that was in `PREPARED` state would still exist in `PREPARED` state in case the server was shutdown abnormally and then started again, but the contents of the transaction could not be written to the binary log. In both of these situations the XA transaction could not be replicated correctly.

In MySQL 5.7.7 and later, there is a change in behavior and an XA transaction is written to the binary log in two parts. When `XA PREPARE` is issued, the first part of the transaction up to `XA PREPARE` is written using an initial GTID. A `XA_prepare_log_event` is used to identify such transactions in the binary log. When `XA COMMIT` or `XA ROLLBACK` is issued, a second part of the transaction containing only the `XA COMMIT` or `XA ROLLBACK` statement is written using a second GTID. Note that the initial part of the transaction, identified by `XA_prepare_log_event`, is not necessarily followed by its `XA COMMIT` or `XA ROLLBACK`, which can cause interleaved binary logging of any two XA transactions. The two parts of the XA transaction can even appear in different binary log files. This means that an XA transaction in `PREPARED` state is now persistent until an explicit `XA COMMIT` or `XA ROLLBACK` statement is issued, ensuring that XA transactions are compatible with replication.

The following restrictions exist for using XA transactions in MySQL 5.7.7 and later:

- XA is not fully resilient to an unexpected halt with respect to the binary log (on the master). If there is an unexpected halt before `XA PREPARE`, between `XA PREPARE` and `XA COMMIT` (or `XA ROLLBACK`), or after `XA COMMIT` (or `XA ROLLBACK`), the server and binary log are correctly recovered and taken to a consistent state. However, if there is an unexpected halt in the middle of the execution of one of these statements, the server may not be able to recover to a correct state, leaving the server and the binary log in an inconsistent state.
- XA does not work with `relay-log-info-repository=TABLE`.
- XA does not work with replication filters or binary log filters. Filters are permitted as long as they do not render any XA transactions empty. Filters that filter out XA transactions may cause the slave to stop with an error.
- In case GTIDs are enabled and the slave does not use either `log-bin=OFF` or does not use `log-slave-updates`, XA transactions are not crash-safe with respect to GTIDs on the slave. If the

slave stops unexpectedly while applying an `XA PREPARE` or `XA COMMIT`, then after recovery `@@GLOBAL.GTID_EXECUTED` may not correctly describe the transactions that have been applied on the slave.

## C.7 Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2`, `utf16`, `utf16le`, and `utf32` character sets have the following restrictions:
  - They cannot be used as a client character set, which means that they do not work for `SET NAMES` or `SET CHARACTER SET`. (See [Section 11.1.4](#), “Connection Character Sets and Collations”.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
  - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
  - The use of `ENCRYPT( )` with these character sets is not recommended because the underlying system call expects a string terminated by a zero byte.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multibyte safe and may produce unexpected results with multibyte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

## C.8 Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `setup_xxx` tables.

Tables in the `performance_schema` database cannot be indexed.

Results for queries that refer to tables in the `performance_schema` database are not saved in the query cache.

Tables in the `performance_schema` database are not replicated.

The Performance Schema is not available in `libmysqld`, the embedded server.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

## C.9 Restrictions on Pluggable Authentication

The first part of this section describes general restrictions on the applicability of the pluggable authentication framework described at [Section 7.3.8, “Pluggable Authentication”](#). The second part describes how third-party connector developers can determine the extent to which a connector can take advantage of pluggable authentication capabilities and what steps to take to become more compliant.

The term “native authentication” used here refers to authentication against passwords stored in the `mysql.user` table. This is the same authentication method provided by older MySQL servers, before pluggable authentication was implemented. It remains the default method, although now it is implemented using plugins. “Windows native authentication” refers to authentication using the credentials of a user who has already logged in to Windows, as implemented by the Windows Native Authentication plugin (“Windows plugin” for short).

## General Pluggable Authentication Restrictions

- **Connector/C, Connector/C++:** Clients that use these connectors can connect to the server only through accounts that use native authentication.

Exception: A connector supports pluggable authentication if it was built to link to `libmysqlclient` dynamically (rather than statically) and it loads the current version of `libmysqlclient` if that version is installed, or if the connector is recompiled from source to link against the current `libmysqlclient`.

- **Connector/J:** Clients that use this connector can connect to the server only through accounts that use native authentication.
- **Connector/Net:** Before Connector/Net 6.4.4, clients that use this connector can connect to the server only through accounts that use native authentication. As of 6.4.4, clients can also connect to the server through accounts that use the Windows plugin.
- **Connector/ODBC:** Before Connector/ODBC 3.51.29 and 5.1.9, clients that use this connector can connect to the server only through accounts that use native authentication. As of 3.51.29 and 5.1.9, clients that use binary releases of this connector for Windows can also connect to the server through accounts that use the PAM or Windows plugins. (These capabilities result from linking the Connector/ODBC binaries against the MySQL 5.5.16 `libmysqlclient` rather than the MySQL 5.1 `libmysqlclient` used previously. The newer `libmysqlclient` includes the client-side support needed for the server-side PAM and Windows authentication plugins.)
- **Connector/PHP:** Clients that use this connector can connect to the server only through accounts that use native authentication, when compiled using the MySQL native driver for PHP (`mysqlnd`).
- **MySQL Proxy:** Before MySQL Proxy 0.8.2, clients can connect to the server only through accounts that use native authentication. As of 0.8.2, clients can also connect to the server through accounts that use the PAM plugin. As of 0.8.3, clients can also connect to the server through accounts that use the Windows plugin.
- **MySQL Enterprise Backup:** MySQL Enterprise Backup before version 3.6.1 supports connections to the server only through accounts that use native authentication. As of 3.6.1, MySQL Enterprise Backup can connect to the server through accounts that use nonnative authentication.
- **Windows native authentication:** Connecting through an account that uses the Windows plugin requires Windows Domain setup. Without it, NTLM authentication is used and then only local connections are possible; that is, the client and server must run on the same computer.
- **Proxy users:** Proxy user support is available to the extent that clients can connect through accounts authenticated with plugins that implement proxy user capability (that is, plugins that can return a user name different from that of the connecting user). For example, the native authentication plugins do not support proxy users, whereas the PAM and Windows plugins do.
- **Replication:** Replication slaves can employ not only master accounts using native authentication, but can also connect through master accounts that use nonnative authentication if the required

client-side plugin is available. If the plugin is built into `libmysqlclient`, it is available by default. Otherwise, the plugin must be installed on the slave side in the directory named by the slave `plugin_dir` system variable.

- **FEDERATED tables:** A `FEDERATED` table can access the remote table only through accounts on the remote server that use native authentication.

## Pluggable Authentication and Third-Party Connectors

Third-party connector developers can use the following guidelines to determine readiness of a connector to take advantage of pluggable authentication capabilities and what steps to take to become more compliant:

- An existing connector to which no changes have been made uses native authentication and clients that use the connector can connect to the server only through accounts that use native authentication. *However, you should test the connector against a recent version of the server to verify that such connections still work without problem.*

Exception: A connector might work with pluggable authentication without any changes if it links to `libmysqlclient` dynamically (rather than statically) and it loads the current version of `libmysqlclient` if that version is installed.

- To take advantage of pluggable authentication capabilities, a connector that is `libmysqlclient`-based should be relinked against the current version of `libmysqlclient`. This enables the connector to support connections through accounts that require client-side plugins now built into `libmysqlclient` (such as the cleartext plugin needed for PAM authentication and the Windows plugin needed for Windows native authentication). Linking with a current `libmysqlclient` also enables the connector to access client-side plugins installed in the default MySQL plugin directory (typically the directory named by the default value of the local server's `plugin_dir` system variable).

If a connector links to `libmysqlclient` dynamically, it must be ensured that the newer version of `libmysqlclient` is installed on the client host and that the connector loads it at runtime.

- Another way for a connector to support a given authentication method is to implement it directly in the client/server protocol. Connector/Net uses this approach to provide support for Windows native authentication.
- If a connector should be able to load client-side plugins from a directory different from the default plugin directory, it must implement some means for client users to specify the directory. Possibilities for this include a command-line option or environment variable from which the connector can obtain the directory name. Standard MySQL client programs such as `mysql` and `mysqladmin` implement a `--plugin-dir` option. See also [Section 26.8.14, “C API Client Plugin Functions”](#).
- Proxy user support by a connector depends, as described earlier in this section, on whether the authentication methods that it supports permit proxy users.

## C.10 Limits in MySQL

This section lists current limits in MySQL 5.7.

### C.10.1 Limits on Joins

The maximum number of tables that can be referenced in a single join is 61. This includes a join handled by merging derived tables (subqueries) and views in the `FROM` clause into the outer query block (see [Optimizing Derived Tables and View References](#)). It also applies to the number of tables that can be referenced in the definition of a view.

### C.10.2 Limits on Number of Databases and Tables

MySQL has no limit on the number of databases. The underlying file system may have a limit on the number of directories.

MySQL has no limit on the number of tables. The underlying file system may have a limit on the number of files that represent tables. Individual storage engines may impose engine-specific constraints. [InnoDB](#) permits up to 4 billion tables.

### C.10.3 Limits on Table Size

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. For up-to-date information operating system file size limits, refer to the documentation specific to your operating system.

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

If you encounter a full-table error, there are several reasons why it might have occurred:

- The disk might be full.
- You are using [InnoDB](#) tables and have run out of room in an [InnoDB](#) tablespace file. The maximum tablespace size is also the maximum size for a table. For tablespace size limits, see [Section 15.8.8, “Limits on InnoDB Tables”](#).

Generally, partitioning of tables into multiple tablespace files is recommended for tables larger than 1TB in size.

- You have hit an operating system file size limit. For example, you are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is permitted by the internal pointer size. [MyISAM](#) permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB ( $256^7 - 1$  bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG\\_ROW\\_LENGTH](#) and [MAX\\_ROWS](#) options. See [Section 14.1.18, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum permissible size. See [Section 14.1.8, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG\\_ROW\\_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [myisam\\_data\\_pointer\\_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX\\_ROWS](#) option. The value of [myisam\\_data\\_pointer\\_size](#) can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use [myisamchk -dv /path/to/table-index-file](#). See [Section 14.7.5, “SHOW Syntax”](#), or [Section 5.6.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for [MyISAM](#) tables are as follows:

- If your large table is read only, you can use [myisampack](#) to compress it. [myisampack](#) usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. [myisampack](#) also can merge multiple tables into a single table. See [Section 5.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a [MERGE](#) library that enables you to handle a collection of [MyISAM](#) tables that have identical structure as a single [MERGE](#) table. See [Section 16.7, “The MERGE Storage Engine”](#).
- You are using the [MEMORY \(HEAP\)](#) storage engine; in this case you need to increase the value of the [max\\_heap\\_table\\_size](#) system variable. See [Section 6.1.5, “Server System Variables”](#).

## C.10.4 Limits on Table Column Count and Row Size

### Column Count Limits

MySQL has hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact column limit depends on several factors:

- The maximum row size for a table constrains the number (and possibly size) of columns because the total length of all columns cannot exceed this size. See [Row Size Limits](#).
- The storage requirements of individual columns constrain the number of columns that fit within a given maximum row size. Storage requirements for some data types depend on factors such as storage engine, storage format, and character set. See [Section 12.8, “Data Type Storage Requirements”](#).
- Storage engines may impose additional restrictions that limit table column count. For example, [InnoDB](#) has a limit of 1017 columns per table. See [Section 15.8.8, “Limits on InnoDB Tables”](#). For information about other storage engines, see [Chapter 16, Alternative Storage Engines](#).
- Each table has an [.frm](#) file that contains the table definition. The definition affects the content of this file in ways that may affect the number of columns permitted in the table. See [Section C.10.5, “Limits Imposed by .frm File Structure”](#).

### Row Size Limits

The maximum row size for a given table is determined by several factors:

- The internal representation of a MySQL table has a maximum row size limit of 65,535 bytes, even if the storage engine is capable of supporting larger rows. [BLOB](#) and [TEXT](#) columns only contribute 9 to 12 bytes toward the row size limit because their contents are stored separately from the rest of the row.
- The maximum row size for an [InnoDB](#) table, which applies to data stored locally within a database page, is slightly less than half a page for 4KB, 8KB, 16KB, and 32KB [innodb\\_page\\_size](#) settings. For example, the maximum row size is slightly less than 8KB for the default 16KB [InnoDB](#) page size. For 64KB pages, the maximum row size is slightly less than 16KB. See [Section 15.8.8, “Limits on InnoDB Tables”](#).

If a row containing [variable-length columns](#) exceeds the [InnoDB](#) maximum row size, [InnoDB](#) selects variable-length columns for external off-page storage until the row fits within the [InnoDB](#) row size limit. The amount of data stored locally for variable-length columns that are stored off-page differs by row format. For more information, see [Section 15.11, “InnoDB Row Storage and Row Formats”](#).

- Different storage formats use different amounts of page header and trailer data, which affects the amount of storage available for rows.
- For information about [InnoDB](#) row formats, see [Section 15.11, “InnoDB Row Storage and Row Formats”](#), and [Section 15.8.3, “Physical Row Structure of InnoDB Tables”](#).

- For information about [MyISAM](#) storage formats, see [Section 16.2.3, “MyISAM Table Storage Formats”](#).

## Row Size Limit Examples

- The MySQL maximum row size limit of 65,535 bytes is demonstrated in the following [InnoDB](#) and [MyISAM](#) examples. The limit is enforced regardless of storage engine, even though the storage engine may be capable of supporting larger rows.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g VARCHAR(6000)) ENGINE=InnoDB CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g VARCHAR(6000)) ENGINE=MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

In the following [MyISAM](#) example, changing a column to [TEXT](#) avoids the 65,535-byte row size limit and permits the operation to succeed because [BLOB](#) and [TEXT](#) columns only contribute 9 to 12 bytes toward the row size.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g TEXT(6000)) ENGINE=MyISAM CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The operation succeeds for an [InnoDB](#) table because changing a column to [TEXT](#) avoids the MySQL 65,535-byte row size limit, and [InnoDB](#) off-page storage of variable-length columns avoids the [InnoDB](#) row size limit.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g TEXT(6000)) ENGINE=InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

- Storage for variable-length columns includes length bytes, which are counted toward the row size. For example, a [VARCHAR\(255\) CHARACTER SET utf8mb3](#) column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

The statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
    (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL)
    ENGINE = InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The statement to create table `t2` fails because, although the column length is within the maximum length of 65,535 bytes, two additional bytes are required to record the length, which causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
    (c1 VARCHAR(65535) NOT NULL)
    ENGINE = InnoDB CHARACTER SET latin1;
```

```
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

Reducing the column length to 65,533 or less permits the statement to succeed.

```
mysql> CREATE TABLE t2
      (c1 VARCHAR(65533) NOT NULL)
      ENGINE = InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.01 sec)
```

- For [MyISAM](#) tables, [NULL](#) columns require additional space in the row to record whether their values are [NULL](#). Each [NULL](#) column takes one bit extra, rounded up to the nearest byte.

The statement to create table [t3](#) fails because [MyISAM](#) requires space for [NULL](#) columns in addition to the space required for variable-length column length bytes, causing the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t3
      (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL)
      ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

For information about [InnoDB NULL](#) column storage, see [Section 15.8.3, “Physical Row Structure of InnoDB Tables”](#).

- [InnoDB](#) restricts row size (for data stored locally within the database page) to slightly less than half a database page for 4KB, 8KB, 16KB, and 32KB [innodb\\_page\\_size](#) settings, and to slightly less than 16KB for 64KB pages.

The statement to create table [t4](#) fails because the defined columns exceed the row size limit for a 16KB [InnoDB](#) page.

```
mysql> CREATE TABLE t4 (
      c1 CHAR(255),c2 CHAR(255),c3 CHAR(255),
      c4 CHAR(255),c5 CHAR(255),c6 CHAR(255),
      c7 CHAR(255),c8 CHAR(255),c9 CHAR(255),
      c10 CHAR(255),c11 CHAR(255),c12 CHAR(255),
      c13 CHAR(255),c14 CHAR(255),c15 CHAR(255),
      c16 CHAR(255),c17 CHAR(255),c18 CHAR(255),
      c19 CHAR(255),c20 CHAR(255),c21 CHAR(255),
      c22 CHAR(255),c23 CHAR(255),c24 CHAR(255),
      c25 CHAR(255),c26 CHAR(255),c27 CHAR(255),
      c28 CHAR(255),c29 CHAR(255),c30 CHAR(255),
      c31 CHAR(255),c32 CHAR(255),c33 CHAR(255)
      ) ENGINE=InnoDB ROW_FORMAT=COMPACT DEFAULT CHARSET latin1;
ERROR 1118 (42000): Row size too large (> 8126). Changing some columns to TEXT or BLOB or using
ROW_FORMAT=DYNAMIC or ROW_FORMAT=COMPRESSED may help. In current row format, BLOB prefix of 768
bytes is stored inline.
```

## C.10.5 Limits Imposed by .frm File Structure

Each table has an [.frm](#) file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the [.frm](#) file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- `info_length` is space needed for “screens.” This is related to MySQL’s Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for `ENUM` and `SET` columns. In this context, “int” does not mean “integer.” It means “interval,” a term that refers collectively to `ENUM` and `SET` columns.
- `int_count` is the number of unique `ENUM` and `SET` definitions.
- `com_length` is the total length of column comments.

The expression just described has several implications for permitted table definitions:

- Using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column comments.
- A table can have no more than 255 unique `ENUM` and `SET` definitions. Columns with identical element lists are considered the same against this limit. For example, if a table contains these two columns, they count as one (not two) toward this limit because the definitions are identical:

```
e1 ENUM('a','b','c')
e2 ENUM('a','b','c')
```

- The sum of the length of element names in the unique `ENUM` and `SET` definitions counts toward the 64KB limit, so although the theoretical limit on number of elements in a given `ENUM` column is 65,535, the practical limit is less than 3000.

## C.10.6 Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Process memory**

On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` option.

- **Limited number of ports**

Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

For more information about this problem, see <http://support.microsoft.com/default.aspx?scid=kb;en-us;196271>.

- **DATA DIRECTORY and INDEX DIRECTORY**

The `DATA DIRECTORY` option for `CREATE TABLE` is supported on Windows only for InnoDB tables, as described in [Section 15.7.5, “Creating a File-Per-Table Tablespace Outside the Data Directory”](#). For MyISAM and other storage engines, the `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows and any other platforms with a nonfunctional `realpath()` call.

- **DROP DATABASE**

You cannot drop a database that is in use by another session.

- **Case-insensitive names**

File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See [Section 10.2.2, “Identifier Case Sensitivity”](#).

- **Directory and file names**

On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

```
datadir="C:/私たちのプロジェクトのデータ"
```

The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The \ path name separator character**

Path name components in Windows are separated by the `\` character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with `/` characters:

```
mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;  
mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
```

Alternatively, you must double the `\` character:

```
mysql> LOAD DATA INFILE 'C:\\tmp\\skr.txt' INTO TABLE skr;  
mysql> SELECT * INTO OUTFILE 'C:\\tmp\\skr.txt' FROM skr;
```

- **Problems with pipes**

Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z / CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

This is mainly a problem when you try to apply a binary log as follows:

```
C:\> mysqlbinlog binary_log_file | mysql --user=root
```

If you have a problem applying the log and suspect that it is because of a `^Z / CHAR(24)` character, you can use the following workaround:

```
C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
```

```
C:\> mysql --user=root --execute "source /tmp/bin.sql"
```

The latter command also can be used to reliably read in any SQL file that may contain binary data.

# MySQL Glossary

These terms are commonly used in information about the MySQL database server. This glossary originated as a reference for terminology about the InnoDB storage engine, and the majority of definitions are InnoDB-related.

## A

### .ARM file

Metadata for [ARCHIVE](#) tables. Contrast with **.ARZ file**. Files with this extension are always included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product. See Also [.ARZ file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### .ARZ file

Data for ARCHIVE tables. Contrast with **.ARM file**. Files with this extension are always included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product. See Also [.ARM file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### ACID

An acronym standing for atomicity, consistency, isolation, and durability. These properties are all desirable in a database system, and are all closely tied to the notion of a **transaction**. The transactional features of [InnoDB](#) adhere to the ACID principles.

Transactions are **atomic** units of work that can be **committed** or **rolled back**. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

The database remains in a consistent state at all times — after each commit or rollback, and while transactions are in progress. If related data is being updated across multiple tables, queries see either all old values or all new values, not a mix of old and new values.

Transactions are protected (isolated) from each other while they are in progress; they cannot interfere with each other or see each other's uncommitted data. This isolation is achieved through the **locking** mechanism. Experienced users can adjust the **isolation level**, trading off less protection in favor of increased performance and **concurrency**, when they can be sure that the transactions really do not interfere with each other.

The results of transactions are durable: once a commit operation succeeds, the changes made by that transaction are safe from power failures, system crashes, race conditions, or other potential dangers that many non-database applications are vulnerable to. Durability typically involves writing to disk storage, with a certain amount of redundancy to protect against power failures or software crashes during write operations. (In [InnoDB](#), the **doublewrite buffer** assists with durability.)

See Also [atomic](#), [commit](#), [concurrency](#), [doublewrite buffer](#), [isolation level](#), [locking](#), [rollback](#), [transaction](#).

### adaptive flushing

An algorithm for [InnoDB](#) tables that smooths out the I/O overhead introduced by **checkpoints**. Instead of **flushing** all modified **pages** from the **buffer pool** to the **data files** at once, MySQL periodically flushes small sets of modified pages. The adaptive flushing algorithm extends this process by estimating the optimal rate to perform these periodic flushes, based on the rate of flushing and how fast **redo** information is generated.

See Also [buffer pool](#), [checkpoint](#), [data files](#), [flush](#), [InnoDB](#), [page](#), [redo log](#).

### adaptive hash index

An optimization for [InnoDB](#) tables that can speed up lookups using `=` and `IN` operators, by constructing a **hash index** in memory. MySQL monitors index searches for [InnoDB](#) tables, and if queries could benefit from a hash index, it builds one automatically for index **pages** that are frequently accessed. In a sense, the adaptive hash index configures MySQL at runtime to take advantage of ample main memory, coming closer to the architecture of main-memory databases. This feature is controlled by the [innodb\\_adaptive\\_hash\\_index](#) configuration option. Because this feature benefits some workloads and not others, and the memory used for the hash index is reserved in the **buffer pool**, typically you should benchmark with this feature both enabled and disabled.

---

The hash index is always built based on an existing [InnoDB secondary index](#), which is organized as a **B-tree** structure. MySQL can build a hash index on a prefix of any length of the key defined for the B-tree, depending on the pattern of searches against the index. A hash index can be partial; the whole B-tree index does not need to be cached in the buffer pool.

In MySQL 5.6 and higher, another way to take advantage of fast single-value lookups with [InnoDB](#) tables is to use the [InnoDB memcached](#) plugin. See [Section 15.20, “InnoDB memcached Plugin”](#) for details.

See Also [B-tree](#), [buffer pool](#), [hash index](#), [memcached](#), [page](#), [secondary index](#).

#### AHI

Acronym for **adaptive hash index**.

See Also [adaptive hash index](#).

#### AIO

Acronym for **asynchronous I/O**. You might see this acronym in [InnoDB](#) messages or keywords.

See Also [asynchronous I/O](#).

#### Antelope

The code name for the original [InnoDB file format](#). It supports the **REDUNDANT** and **COMPACT** row formats, but not the newer **DYNAMIC** and **COMPRESSED** row formats available in the **Barracuda** file format.

See Also [Barracuda](#), [compact row format](#), [compressed row format](#), [dynamic row format](#), [file format](#), [innodb\\_file\\_format](#), [redundant row format](#).

#### application programming interface (API)

A set of functions or procedures. An API provides a stable set of names and types for functions, procedures, parameters, and return values.

#### apply

When a backup produced by the **MySQL Enterprise Backup** product does not include the most recent changes that occurred while the backup was underway, the process of updating the backup files to include those changes is known as the **apply** step. It is specified by the [apply-log](#) option of the [mysqlbackup](#) command.

Before the changes are applied, we refer to the files as a **raw backup**. After the changes are applied, we refer to the files as a **prepared backup**. The changes are recorded in the [ibbackup\\_logfile](#) file; once the apply step is finished, this file is no longer necessary.

See Also [hot backup](#), [ibbackup\\_logfile](#), [MySQL Enterprise Backup](#), [prepared backup](#), [raw backup](#).

#### asynchronous I/O

A type of I/O operation that allows other processing to proceed before the I/O is completed. Also known as **non-blocking I/O** and abbreviated as **AIO**. [InnoDB](#) uses this type of I/O for certain operations that can run in parallel without affecting the reliability of the database, such as reading pages into the **buffer pool** that have not actually been requested, but might be needed soon.

Historically, [InnoDB](#) used asynchronous I/O on Windows systems only. Starting with the [InnoDB Plugin 1.1](#) and MySQL 5.5, [InnoDB](#) uses asynchronous I/O on Linux systems. This change introduces a dependency on [libaio](#). Asynchronous I/O on Linux systems is configured using the [innodb\\_use\\_native\\_aio](#) option, which is enabled by default. On other Unix-like systems, [InnoDB](#) uses synchronous I/O only.

See Also [buffer pool](#), [non-blocking I/O](#).

#### atomic

In the SQL context, **transactions** are units of work that either succeed entirely (when **committed**) or have no effect at all (when **rolled back**). The indivisible ("atomic") property of transactions is the "A" in the acronym **ACID**.

See Also [ACID](#), [commit](#), [rollback](#), [transaction](#).

#### atomic instruction

Special instructions provided by the CPU, to ensure that critical low-level operations cannot be interrupted.

#### auto-increment

A property of a table column (specified by the [AUTO\\_INCREMENT](#) keyword) that automatically adds an ascending sequence of values in the column. [InnoDB](#) supports auto-increment only for **primary key** columns.

---

It saves work for the developer, not to have to produce new unique values when inserting new rows. It provides useful information for the query optimizer, because the column is known to be not null and with unique values. The values from such a column can be used as lookup keys in various contexts, and because they are auto-generated there is no reason to ever change them; for this reason, primary key columns are often specified as auto-incrementing.

Auto-increment columns can be problematic with statement-based replication, because replaying the statements on a slave might not produce the same set of column values as on the master, due to timing issues. When you have an auto-incrementing primary key, you can use statement-based replication only with the setting `innodb_autoinc_lock_mode=1`. If you have `innodb_autoinc_lock_mode=2`, which allows higher concurrency for insert operations, use **row-based replication** rather than **statement-based replication**. The setting `innodb_autoinc_lock_mode=0` is the previous (traditional) default setting and should not be used except for compatibility purposes.

See Also [auto-increment locking](#), [innodb\\_autoinc\\_lock\\_mode](#), [primary key](#), [row-based replication](#), [statement-based replication](#).

#### auto-increment locking

The convenience of an **auto-increment** primary key involves some tradeoff with concurrency. In the simplest case, if one transaction is inserting values into the table, any other transactions must wait to do their own inserts into that table, so that rows inserted by the first transaction receive consecutive primary key values. [InnoDB](#) includes optimizations, and the `innodb_autoinc_lock_mode` option, so that you can choose how to trade off between predictable sequences of auto-increment values and maximum **concurrency** for insert operations.

See Also [auto-increment](#), [concurrency](#), [innodb\\_autoinc\\_lock\\_mode](#).

#### autocommit

A setting that causes a **commit** operation after each **SQL** statement. This mode is not recommended for working with [InnoDB](#) tables with **transactions** that span several statements. It can help performance for **read-only transactions** on [InnoDB](#) tables, where it minimizes overhead from **locking** and generation of **undo** data, especially in MySQL 5.6.4 and up. It is also appropriate for working with [MyISAM](#) tables, where transactions are not applicable.

See Also [commit](#), [locking](#), [read-only transaction](#), [SQL](#), [transaction](#), [undo](#).

#### availability

The ability to cope with, and if necessary recover from, failures on the host, including failures of MySQL, the operating system, or the hardware and maintenance activity that may otherwise cause downtime. Often paired with **scalability** as critical aspects of a large-scale deployment.

See Also [scalability](#).

## B

#### B-tree

A tree data structure that is popular for use in database indexes. The structure is kept sorted at all times, enabling fast lookup for exact matches (equals operator) and ranges (for example, greater than, less than, and [BETWEEN](#) operators). This type of index is available for most storage engines, such as [InnoDB](#) and [MyISAM](#).

Because B-tree nodes can have many children, a B-tree is not the same as a binary tree, which is limited to 2 children per node.

Contrast with **hash index**, which is only available in the [MEMORY](#) storage engine. The [MEMORY](#) storage engine can also use B-tree indexes, and you should choose B-tree indexes for [MEMORY](#) tables if some queries use range operators.

The use of the term B-tree is intended as a reference to the general class of index design. B-tree structures used by MySQL storage engines may be regarded as variants due to sophistications not present in a classic B-tree design. For related information, refer to the [InnoDB Page Structure Fil Header](#) section of the [MySQL Internals Manual](#).

See Also [hash index](#).

---

## backticks

Identifiers within MySQL SQL statements must be quoted using the backtick character ( ``` ) if they contain special characters or reserved words. For example, to refer to a table named `FOO#BAR` or a column named `SELECT`, you would specify the identifiers as ``FOO#BAR`` and ``SELECT``. Since the backticks provide an extra level of safety, they are used extensively in program-generated SQL statements, where the identifier names might not be known in advance.

Many other database systems use double quotation marks ( `"` ) around such special names. For portability, you can enable `ANSI_QUOTES` mode in MySQL and use double quotation marks instead of backticks to qualify identifier names.

See Also [SQL](#).

## backup

The process of copying some or all table data and metadata from a MySQL instance, for safekeeping. Can also refer to the set of copied files. This is a crucial task for DBAs. The reverse of this process is the **restore** operation.

With MySQL, **physical backups** are performed by the **MySQL Enterprise Backup** product, and **logical backups** are performed by the `mysqldump` command. These techniques have different characteristics in terms of size and representation of the backup data, and speed (especially speed of the restore operation).

Backups are further classified as **hot**, **warm**, or **cold** depending on how much they interfere with normal database operation. (Hot backups have the least interference, cold backups the most.)

See Also [cold backup](#), [hot backup](#), [logical backup](#), [MySQL Enterprise Backup](#), [mysqldump](#), [physical backup](#), [warm backup](#).

## Barracuda

The code name for an `InnoDB` **file format** that supports the **COMPRESSED** row format that enables InnoDB table compression, and the **DYNAMIC** row format that improves the storage layout for long variable-length columns.

The **MySQL Enterprise Backup** product version 3.5 and above supports backing up tablespaces that use the Barracuda file format.

See Also [Antelope](#), [compact row format](#), [compressed row format](#), [dynamic row format](#), [file format](#), [file-per-table](#), [general tablespace](#), [innodb\\_file\\_format](#), [MySQL Enterprise Backup](#), [row format](#), [system tablespace](#).

## base column

A non-generated table column upon which a generated stored column or generated virtual column is based. In other words, a base column is a non-generated table column that is part of a generated column definition.

See Also [generated column](#), [generated stored column](#), [generated virtual column](#).

## beta

An early stage in the life of a software product, when it is available only for evaluation, typically without a definite release number or a number less than 1. `InnoDB` does not use the beta designation, preferring an **early adopter** phase that can extend over several point releases, leading to a **GA** release.

See Also [early adopter](#), [GA](#).

## binary log

A file containing a record of all statements that attempt to change table data. These statements can be replayed to bring slave servers up to date in a **replication** scenario, or to bring a database up to date after restoring table data from a backup. The binary logging feature can be turned on and off, although Oracle recommends always enabling it if you use replication or perform backups.

You can examine the contents of the binary log, or replay those statements during replication or recovery, by using the `mysqlbinlog` command. For full information about the binary log, see [Section 6.4.4, “The Binary Log”](#). For MySQL configuration options related to the binary log, see [Section 18.1.6.4, “Binary Logging Options and Variables”](#).

For the **MySQL Enterprise Backup** product, the file name of the binary log and the current position within the file are important details. To record this information for the master server when taking a backup in a replication context, you can specify the `--slave-info` option.

---

Prior to MySQL 5.0, a similar capability was available, known as the update log. In MySQL 5.0 and higher, the binary log replaces the update log.

See Also [binlog](#), [MySQL Enterprise Backup](#), [replication](#).

#### binlog

An informal name for the **binary log** file. For example, you might see this abbreviation used in e-mail messages or forum discussions.

See Also [binary log](#).

#### blind query expansion

A special mode of **full-text search** enabled by the `WITH QUERY EXPANSION` clause. It performs the search twice, where the search phrase for the second search is the original search phrase concatenated with the few most highly relevant documents from the first search. This technique is mainly applicable for short search phrases, perhaps only a single word. It can uncover relevant matches where the precise search term does not occur in the document.

See Also [full-text search](#).

#### bottleneck

A portion of a system that is constrained in size or capacity, that has the effect of limiting overall throughput. For example, a memory area might be smaller than necessary; access to a single required resource might prevent multiple CPU cores from running simultaneously; or waiting for disk I/O to complete might prevent the CPU from running at full capacity. Removing bottlenecks tends to improve **concurrency**. For example, the ability to have multiple [InnoDB buffer pool](#) instances reduces contention when multiple sessions read from and write to the buffer pool simultaneously.

See Also [buffer pool](#), [concurrency](#).

#### bounce

A **shutdown** operation immediately followed by a restart. Ideally with a relatively short **warmup** period so that performance and throughput quickly return to a high level.

See Also [shutdown](#).

#### buddy allocator

A mechanism for managing different-sized **pages** in the [InnoDB buffer pool](#).

See Also [buffer pool](#), [page](#), [page size](#).

#### buffer

A memory or disk area used for temporary storage. Data is buffered in memory so that it can be written to disk efficiently, with a few large I/O operations rather than many small ones. Data is buffered on disk for greater reliability, so that it can be recovered even when a **crash** or other failure occurs at the worst possible time. The main types of buffers used by [InnoDB](#) are the **buffer pool**, the **doublewrite buffer**, and the **change buffer**.

See Also [buffer pool](#), [change buffer](#), [crash](#), [doublewrite buffer](#).

#### buffer pool

The memory area that holds cached [InnoDB](#) data for both tables and indexes. For efficiency of high-volume read operations, the buffer pool is divided into **pages** that can potentially hold multiple rows. For efficiency of cache management, the buffer pool is implemented as a linked list of pages; data that is rarely used is aged out of the cache, using a variation of the **LRU** algorithm. On systems with large memory, you can improve concurrency by dividing the buffer pool into multiple **buffer pool instances**.

Several [InnoDB](#) status variables, `INFORMATION_SCHEMA` tables, and `performance_schema` tables help to monitor the internal workings of the buffer pool. Starting in MySQL 5.6, you can avoid a lengthy warmup period after restarting the server, particularly for instances with large buffer pools, by saving the buffer pool state at server shutdown and restoring the buffer pool to the same state at server startup. See [Section 15.6.3.8, “Saving and Restoring the Buffer Pool State”](#).

See Also [buffer pool instance](#), [LRU](#), [page](#), [warm up](#).

#### buffer pool instance

Any of the multiple regions into which the **buffer pool** can be divided, controlled by the `innodb_buffer_pool_instances` configuration option. The total memory size specified by

---

`innodb_buffer_pool_size` is divided among all buffer pool instances. Typically, having multiple buffer pool instances is appropriate for systems that allocate multiple gigabytes to the [InnoDB](#) buffer pool, with each instance being one gigabyte or larger. On systems loading or looking up large amounts of data in the buffer pool from many concurrent sessions, having multiple buffer pool instances reduces contention for exclusive access to data structures that manage the buffer pool.

See Also [buffer pool](#).

#### built-in

The built-in [InnoDB](#) storage engine within MySQL is the original form of distribution for the storage engine. Contrast with the **InnoDB Plugin**. Starting with MySQL 5.5, the InnoDB Plugin is merged back into the MySQL code base as the built-in [InnoDB](#) storage engine (known as InnoDB 1.1).

This distinction is important mainly in MySQL 5.1, where a feature or bug fix might apply to the InnoDB Plugin but not the built-in [InnoDB](#), or vice versa.

See Also [InnoDB](#).

#### business rules

The relationships and sequences of actions that form the basis of business software, used to run a commercial company. Sometimes these rules are dictated by law, other times by company policy. Careful planning ensures that the relationships encoded and enforced by the database, and the actions performed through application logic, accurately reflect the real policies of the company and can handle real-life situations.

For example, an employee leaving a company might trigger a sequence of actions from the human resources department. The human resources database might also need the flexibility to represent data about a person who has been hired, but not yet started work. Closing an account at an online service might result in data being removed from a database, or the data might be moved or flagged so that it could be recovered if the account is re-opened. A company might establish policies regarding salary maximums, minimums, and adjustments, in addition to basic sanity checks such as the salary not being a negative number. A retail database might not allow a purchase with the same serial number to be returned more than once, or might not allow credit card purchases above a certain value, while a database used to detect fraud might allow these kinds of things.

See Also [relational](#).

## C

#### .cfg file

A metadata file used with the [InnoDB transportable tablespace](#) feature. It is produced by the command `FLUSH TABLES ... FOR EXPORT`, puts one or more tables in a consistent state that can be copied to another server. The `.cfg` file is copied along with the corresponding `.ibd` file, and used to adjust the internal values of the `.ibd` file, such as the **space ID**, during the `ALTER TABLE ... IMPORT TABLESPACE` step.

See Also [.ibd file](#), [space ID](#), [transportable tablespace](#).

#### cache

The general term for any memory area that stores copies of data for frequent or high-speed retrieval. In [InnoDB](#), the primary kind of cache structure is the **buffer pool**.

See Also [buffer](#), [buffer pool](#).

#### cardinality

The number of different values in a table **column**. When queries refer to columns that have an associated **index**, the cardinality of each column influences which access method is most efficient. For example, for a column with a **unique constraint**, the number of different values is equal to the number of rows in the table. If a table has a million rows but only 10 different values for a particular column, each value occurs (on average) 100,000 times. A query such as `SELECT c1 FROM t1 WHERE c1 = 50;` thus might return 1 row or a huge number of rows, and the database server might process the query differently depending on the cardinality of `c1`.

If the values in a column have a very uneven distribution, the cardinality might not be a good way to determine the best query plan. For example, `SELECT c1 FROM t1 WHERE c1 = x;` might return 1 row when `x=50`

---

and a million rows when `x=30`. In such a case, you might need to use **index hints** to pass along advice about which lookup method is more efficient for a particular query.

Cardinality can also apply to the number of distinct values present in multiple columns, as in a **composite index**.

See Also [column](#), [composite index](#), [index](#), [index hint](#), [persistent statistics](#), [random dive](#), [selectivity](#), [unique constraint](#).

#### change buffer

A special data structure that records changes to **pages** in **secondary indexes**. These values could result from SQL `INSERT`, `UPDATE`, or `DELETE` statements (**DML**). The set of features involving the change buffer is known collectively as **change buffering**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**.

Changes are only recorded in the change buffer when the relevant page from the secondary index is not in the **buffer pool**. When the relevant index page is brought into the buffer pool while associated changes are still in the change buffer, the changes for that page are applied in the buffer pool (**merged**) using the data from the change buffer. Periodically, the **purge** operation that runs during times when the system is mostly idle, or during a slow shutdown, writes the new index pages to disk. The purge operation can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately.

Physically, the change buffer is part of the **system tablespace**, so that the index changes remain buffered across database restarts. The changes are only applied (**merged**) when the pages are brought into the buffer pool due to some other read operation.

The kinds and amount of data stored in the change buffer are governed by the `innodb_change_buffering` and `innodb_change_buffer_max_size` configuration options. To see information about the current data in the change buffer, issue the `SHOW ENGINE INNODB STATUS` command.

Formerly known as the **insert buffer**.

See Also [buffer pool](#), [change buffering](#), [delete buffering](#), [DML](#), [insert buffer](#), [insert buffering](#), [merge](#), [page](#), [purge](#), [purge buffering](#), [secondary index](#), [system tablespace](#).

#### change buffering

The general term for the features involving the **change buffer**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**. Index changes resulting from SQL statements, which could normally involve random I/O operations, are held back and performed periodically by a background **thread**.

This sequence of operations can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately. Controlled by the `innodb_change_buffering` and `innodb_change_buffer_max_size` configuration options.

See Also [change buffer](#), [delete buffering](#), [insert buffering](#), [purge buffering](#).

#### checkpoint

As changes are made to data pages that are cached in the **buffer pool**, those changes are written to the **data files** sometime later, a process known as **flushing**. The checkpoint is a record of the latest changes (represented by an **LSN** value) that have been successfully written to the data files.

See Also [buffer pool](#), [data files](#), [flush](#), [fuzzy checkpointing](#), [LSN](#).

#### checksum

In **InnoDB**, a validation mechanism to detect corruption when a **page** in a **tablespace** is read from disk into the **InnoDB buffer pool**. This feature is controlled by the `innodb_checksums` configuration option in MySQL 5.5. `innodb_checksums` is deprecated in MySQL 5.6.3, replaced by `innodb_checksum_algorithm`.

The `innochecksum` command helps diagnose corruption problems by testing the checksum values for a specified **tablespace** file while the MySQL server is shut down.

MySQL also uses checksums for replication purposes. For details, see the configuration options `binlog_checksum`, `master_verify_checksum`, and `slave_sql_verify_checksum`.

See Also [buffer pool](#), [page](#), [tablespace](#).

---

#### child table

In a **foreign key** relationship, a child table is one whose rows refer (or point) to rows in another table with an identical value for a specific column. This is the table that contains the `FOREIGN KEY ... REFERENCES` clause and optionally `ON UPDATE` and `ON DELETE` clauses. The corresponding row in the **parent table** must exist before the row can be created in the child table. The values in the child table can prevent delete or update operations on the parent table, or can cause automatic deletion or updates in the child table, based on the `ON CASCADE` option used when creating the foreign key.

See Also [foreign key](#), [parent table](#).

#### clean page

A **page** in the [InnoDB buffer pool](#) where all changes made in memory have also been written (**flushed**) to the [data files](#). The opposite of a **dirty page**.

See Also [buffer pool](#), [data files](#), [dirty page](#), [flush](#), [page](#).

#### clean shutdown

A **shutdown** that completes without errors and applies all changes to [InnoDB](#) tables before finishing, as opposed to a **crash** or a **fast shutdown**. Synonym for **slow shutdown**.

See Also [crash](#), [fast shutdown](#), [shutdown](#), [slow shutdown](#).

#### client

A type of program that sends requests to a **server**, and interprets or processes the results. The client software might run only some of the time (such as a mail or chat program), and might run interactively (such as the `mysql` command processor).

See Also [mysql](#), [server](#).

#### clustered index

The [InnoDB](#) term for a **primary key** index. [InnoDB](#) table storage is organized based on the values of the primary key columns, to speed up queries and sorts involving the primary key columns. For best performance, choose the primary key columns carefully based on the most performance-critical queries. Because modifying the columns of the clustered index is an expensive operation, choose primary columns that are rarely or never updated.

In the Oracle Database product, this type of table is known as an **index-organized table**.

See Also [index](#), [primary key](#), [secondary index](#).

#### cold backup

A **backup** taken while the database is shut down. For busy applications and web sites, this might not be practical, and you might prefer a **warm backup** or a **hot backup**.

See Also [backup](#), [hot backup](#), [warm backup](#).

#### column

A data item within a **row**, whose storage and semantics are defined by a data type. Each **table** and **index** is largely defined by the set of columns it contains.

Each column has a **cardinality** value. A column can be the **primary key** for its table, or part of the primary key. A column can be subject to a **unique constraint**, a **NOT NULL constraint**, or both. Values in different columns, even across different tables, can be linked by a **foreign key** relationship.

In discussions of MySQL internal operations, sometimes **field** is used as a synonym.

See Also [cardinality](#), [foreign key](#), [index](#), [NOT NULL constraint](#), [primary key](#), [row](#), [table](#), [unique constraint](#).

#### column index

An **index** on a single column.

See Also [composite index](#), [index](#).

#### column prefix

When an **index** is created with a length specification, such as `CREATE INDEX idx ON t1 (c1(N))`, only the first N characters of the column value are stored in the index. Keeping the index prefix small makes the index compact, and the memory and disk I/O savings help performance. (Although making the index prefix too

---

small can hinder query optimization by making rows with different values appear to the query optimizer to be duplicates.)

For columns containing binary values or long text strings, where sorting is not a major consideration and storing the entire value in the index would waste space, the index automatically uses the first N (typically 768) characters of the value to do lookups and sorts.

See Also [index](#).

#### commit

A **SQL** statement that ends a **transaction**, making permanent any changes made by the transaction. It is the opposite of **rollback**, which undoes any changes made in the transaction.

**InnoDB** uses an **optimistic** mechanism for commits, so that changes can be written to the data files before the commit actually occurs. This technique makes the commit itself faster, with the tradeoff that more work is required in case of a rollback.

By default, MySQL uses the **autocommit** setting, which automatically issues a commit following each SQL statement.

See Also [autocommit](#), [optimistic](#), [rollback](#), [SQL](#), [transaction](#).

#### compact row format

The default **InnoDB row format** for InnoDB tables from MySQL 5.0.3 to MySQL 5.7.8. As of MySQL 5.7.9, the default row format is defined by the `innodb_default_row_format` configuration option, which has a default setting of **DYNAMIC**. The **COMPACT** row format provides a more compact representation for nulls and variable-length columns than the prior default (**REDUNDANT** row format).

For additional information about **InnoDB COMPACT** row format, see [Section 15.11.4, “COMPACT and REDUNDANT Row Formats”](#).

See Also [Antelope](#), [dynamic row format](#), [file format](#), [redundant row format](#), [row format](#).

#### composite index

An **index** that includes multiple columns.

See Also [index](#).

#### compressed backup

The compression feature of the **MySQL Enterprise Backup** product makes a compressed copy of each tablespace, changing the extension from `.ibd` to `.ibz`. Compressing backup data allows you to keep more backups on hand, and reduces the time to transfer backups to a different server. The data is uncompressed during the restore operation. When a compressed backup operation processes a table that is already compressed, it skips the compression step for that table, because compressing again would result in little or no space savings.

A set of files produced by the **MySQL Enterprise Backup** product, where each **tablespace** is compressed. The compressed files are renamed with a `.ibz` file extension.

Applying **compression** at the start of the backup process helps to avoid storage overhead during the compression process, and to avoid network overhead when transferring the backup files to another server. The process of **applying** the **binary log** takes longer, and requires uncompressing the backup files.

See Also [apply](#), [binary log](#), [compression](#), [hot backup](#), [MySQL Enterprise Backup](#), [tablespace](#).

#### compressed row format

A **row format** that enables data and index **compression** for **InnoDB** tables. It was introduced in the **InnoDB** Plugin, available as part of the **Barracuda** file format. Large fields are stored away from the page that holds the rest of the row data, as in **dynamic row format**. Both index pages and large fields are compressed, yielding memory and disk savings. Depending on the structure of the data, the decrease in memory and disk usage might or might not outweigh the performance overhead of uncompressing the data as it is used. See [Section 15.9, “InnoDB Table and Page Compression”](#) for usage details.

For additional information about **InnoDB COMPRESSED** row format, see [Section 15.11.3, “DYNAMIC and COMPRESSED Row Formats”](#).

See Also [Barracuda](#), [compression](#), [dynamic row format](#), [row format](#).

---

#### compressed table

A table for which the data is stored in compressed form. For [InnoDB](#), it is a table created with `ROW_FORMAT=COMPRESSED`. See [Section 15.9, “InnoDB Table and Page Compression”](#) for more information. See Also [compressed row format](#), [compression](#).

#### compression

A feature with wide-ranging benefits from using less disk space, performing less I/O, and using less memory for caching.

[InnoDB](#) supports both table-level and page-level compression. [InnoDB](#) page compression is also referred to as **transparent page compression**. For more information about [InnoDB](#) compression, see [Section 15.9, “InnoDB Table and Page Compression”](#).

Another type of compression is the **compressed backup** feature of the **MySQL Enterprise Backup** product. See Also [Barracuda](#), [buffer pool](#), [compressed backup](#), [compressed row format](#), [DML](#), [transparent page compression](#).

#### compression failure

Not actually an error, rather an expensive operation that can occur when using **compression** in combination with **DML** operations. It occurs when: updates to a compressed **page** overflow the area on the page reserved for recording modifications; the page is compressed again, with all changes applied to the table data; the re-compressed data does not fit on the original page, requiring MySQL to split the data into two new pages and compress each one separately. To check the frequency of this condition, query the `INFORMATION_SCHEMA.INNODB_CMP` table and check how much the value of the `COMPRESS_OPS` column exceeds the value of the `COMPRESS_OPS_OK` column. Ideally, compression failures do not occur often; when they do, you can adjust the `innodb_compression_level`, `innodb_compression_failure_threshold_pct`, and `innodb_compression_pad_pct_max` configuration options.

See Also [compression](#), [DML](#), [page](#).

#### concatenated index

See [composite index](#).

#### concurrency

The ability of multiple operations (in database terminology, **transactions**) to run simultaneously, without interfering with each other. Concurrency is also involved with performance, because ideally the protection for multiple simultaneous transactions works with a minimum of performance overhead, using efficient mechanisms for **locking**.

See Also [ACID](#), [locking](#), [transaction](#).

#### configuration file

The file that holds the **option** values used by MySQL at startup. Traditionally, on Linux and Unix this file is named `my.cnf`, and on Windows it is named `my.ini`. You can set a number of options related to InnoDB under the `[mysqld]` section of the file.

See [Section 5.2.6, “Using Option Files”](#) for information about where MySQL searches for configuration files.

When you use the **MySQL Enterprise Backup** product, you typically use two configuration files: one that specifies where the data comes from and how it is structured (which could be the original configuration file for your server), and a stripped-down one containing only a small set of options that specify where the backup data goes and how it is structured. The configuration files used with the **MySQL Enterprise Backup** product must contain certain options that are typically left out of regular configuration files, so you might need to add options to your existing configuration file for use with **MySQL Enterprise Backup**.

See Also [my.cnf](#), [MySQL Enterprise Backup](#), [option](#), [option file](#).

#### consistent read

A read operation that uses **snapshot** information to present query results based on a point in time, regardless of changes performed by other transactions running at the same time. If queried data has been changed by another transaction, the original data is reconstructed based on the contents of the **undo log**. This technique avoids some of the **locking** issues that can reduce **concurrency** by forcing transactions to wait for other transactions to finish.

---

With **REPEATABLE READ isolation level**, the snapshot is based on the time when the first read operation is performed. With **READ COMMITTED** isolation level, the snapshot is reset to the time of each consistent read operation.

Consistent read is the default mode in which **InnoDB** processes **SELECT** statements in **READ COMMITTED** and **REPEATABLE READ** isolation levels. Because a consistent read does not set any locks on the tables it accesses, other sessions are free to modify those tables while a consistent read is being performed on the table.

For technical details about the applicable isolation levels, see [Section 15.5.2.3, “Consistent Nonlocking Reads”](#).

See Also [concurrency](#), [isolation level](#), [locking](#), [READ COMMITTED](#), [REPEATABLE READ](#), [snapshot](#), [transaction](#), [undo log](#).

#### constraint

An automatic test that can block database changes to prevent data from becoming inconsistent. (In computer science terms, a kind of assertion related to an invariant condition.) Constraints are a crucial component of the **ACID** philosophy, to maintain data consistency. Constraints supported by MySQL include **FOREIGN KEY constraints** and **unique constraints**.

See Also [ACID](#), [foreign key](#), [unique constraint](#).

#### counter

A value that is incremented by a particular kind of **InnoDB** operation. Useful for measuring how busy a server is, troubleshooting the sources of performance issues, and testing whether changes (for example, to configuration settings or indexes used by queries) have the desired low-level effects. Different kinds of counters are available through **Performance Schema** tables and **INFORMATION\_SCHEMA** tables, particularly [INFORMATION\\_SCHEMA.INNODB\\_METRICS](#).

See Also [INFORMATION\\_SCHEMA](#), [metrics counter](#), [Performance Schema](#).

#### covering index

An **index** that includes all the columns retrieved by a query. Instead of using the index values as pointers to find the full table rows, the query returns values from the index structure, saving disk I/O. **InnoDB** can apply this optimization technique to more indexes than MyISAM can, because **InnoDB secondary indexes** also include the **primary key** columns. **InnoDB** cannot apply this technique for queries against tables modified by a transaction, until that transaction ends.

Any **column index** or **composite index** could act as a covering index, given the right query. Design your indexes and queries to take advantage of this optimization technique wherever possible.

See Also [column index](#), [composite index](#), [index](#), [primary key](#), [secondary index](#).

#### CPU-bound

A type of **workload** where the primary **bottleneck** is CPU operations in memory. Typically involves read-intensive operations where the results can all be cached in the **buffer pool**.

See Also [bottleneck](#), [buffer pool](#), [workload](#).

#### crash

MySQL uses the term “crash” to refer generally to any unexpected **shutdown** operation where the server cannot do its normal cleanup. For example, a crash could happen due to a hardware fault on the database server machine or storage device; a power failure; a potential data mismatch that causes the MySQL server to halt; a **fast shutdown** initiated by the DBA; or many other reasons. The robust, automatic **crash recovery** for **InnoDB** tables ensures that data is made consistent when the server is restarted, without any extra work for the DBA.

See Also [crash recovery](#), [fast shutdown](#), [InnoDB](#), [shutdown](#).

#### crash recovery

The cleanup activities that occur when MySQL is started again after a **crash**. For **InnoDB** tables, changes from incomplete transactions are replayed using data from the **redo log**. Changes that were **committed** before the crash, but not yet written into the **data files**, are reconstructed from the **doublewrite buffer**. When the database is shut down normally, this type of activity is performed during shutdown by the **purge** operation.

---

During normal operation, committed data can be stored in the **change buffer** for a period of time before being written to the data files. There is always a tradeoff between keeping the data files up-to-date, which introduces performance overhead during normal operation, and buffering the data, which can make shutdown and crash recovery take longer.

See Also [change buffer](#), [commit](#), [crash](#), [data files](#), [doublewrite buffer](#), [InnoDB](#), [purge](#), [redo log](#).

## CRUD

Acronym for “create, read, update, delete”, a common sequence of operations in database applications. Often denotes a class of applications with relatively simple database usage (basic **DDL**, **DML** and **query** statements in **SQL**) that can be implemented quickly in any language.

See Also [DDL](#), [DML](#), [query](#), [SQL](#).

## cursor

An internal data structure that is used to represent the result set of a **query**, or other operation that performs a search using an SQL [WHERE](#) clause. It works like an iterator in other high-level languages, producing each value from the result set as requested.

Although SQL usually handles the processing of cursors for you, you might delve into the inner workings when dealing with performance-critical code.

See Also [query](#).

# D

## data definition language

See [DDL](#).

## data dictionary

Metadata that keeps track of InnoDB-related objects such as **tables**, **indexes**, and table **columns**. This metadata is physically located in the [InnoDB system tablespace](#). For historical reasons, it overlaps to some degree with information stored in the **.frm files**.

Because the **MySQL Enterprise Backup** product always backs up the system tablespace, all backups include the contents of the data dictionary.

See Also [column](#), [file-per-table](#), [.frm file](#), [index](#), [MySQL Enterprise Backup](#), [system tablespace](#), [table](#).

## data directory

The directory under which each MySQL **instance** keeps the **data files** for [InnoDB](#) and the directories representing individual databases. Controlled by the [datadir](#) configuration option.

See Also [data files](#), [instance](#).

## data files

The files that physically contain **table** and **index** data.

The [InnoDB system tablespace](#), which holds the [InnoDB data dictionary](#) and is capable of holding data for multiple [InnoDB](#) tables, is represented by one or more [.ibdata](#) data files.

File-per-table tablespaces, which hold data for a single [InnoDB](#) table, are represented by a [.ibd](#) data file.

General tablespaces (introduced in MySQL 5.7.6), which can hold data for multiple [InnoDB](#) tables, are also represented by a [.ibd](#) data file.

See Also [data dictionary](#), [file-per-table](#), [general tablespace](#), [.ibd file](#), [ibdata file](#), [index](#), [system tablespace](#), [table](#), [tablespace](#).

## data manipulation language

See [DML](#).

## data warehouse

A database system or application that primarily runs large **queries**. The read-only or read-mostly data might be organized in **denormalized** form for query efficiency. Can benefit from the optimizations for **read-only transactions** in MySQL 5.6 and higher. Contrast with **OLTP**.

---

See Also [denormalized](#), [OLTP](#), [query](#), [read-only transaction](#).

#### database

Within the MySQL **data directory**, each database is represented by a separate directory. The InnoDB **system tablespace**, which can hold table data from multiple databases within a MySQL **instance**, is kept in **data files** that reside outside of individual database directories. When **file-per-table** mode is enabled, the **.ibd files** representing individual InnoDB tables are stored inside the database directories unless created elsewhere using the [DATA DIRECTORY](#) clause. General tablespaces, introduced in MySQL 5.7.6, also hold table data in **.ibd files**. Unlike file-per-table **.ibd files**, general tablespace **.ibd files** can hold table data from multiple databases within a MySQL **instance**, and can be assigned to directories relative to or independent of the MySQL data directory.

For long-time MySQL users, a database is a familiar notion. Users coming from an Oracle Database background will find that the MySQL meaning of a database is closer to what Oracle Database calls a **schema**.

See Also [data files](#), [file-per-table](#), [.ibd file](#), [instance](#), [schema](#), [system tablespace](#).

#### DCL

Data control language, a set of **SQL** statements for managing privileges. In MySQL, consists of the [GRANT](#) and [REVOKE](#) statements. Contrast with **DDL** and **DML**.

See Also [DDL](#), [DML](#), [SQL](#).

#### DDL

Data definition language, a set of **SQL** statements for manipulating the database itself rather than individual table rows. Includes all forms of the [CREATE](#), [ALTER](#), and [DROP](#) statements. Also includes the [TRUNCATE](#) statement, because it works differently than a [DELETE FROM table\\_name](#) statement, even though the ultimate effect is similar.

DDL statements automatically **commit** the current **transaction**; they cannot be **rolled back**.

The [InnoDB online DDL](#) feature enhances performance for [CREATE INDEX](#), [DROP INDEX](#), and many types of [ALTER TABLE](#) operations. See [Section 15.13, “InnoDB and Online DDL”](#) for more information. Also, the [InnoDB file-per-table](#) setting can affect the behavior of [DROP TABLE](#) and [TRUNCATE TABLE](#) operations.

Contrast with **DML** and **DCL**.

See Also [commit](#), [DCL](#), [DML](#), [file-per-table](#), [rollback](#), [SQL](#), [transaction](#).

#### deadlock

A situation where different **transactions** are unable to proceed, because each holds a **lock** that the other needs. Because both transactions are waiting for a resource to become available, neither will ever release the locks it holds.

A deadlock can occur when the transactions lock rows in multiple tables (through statements such as [UPDATE](#) or [SELECT ... FOR UPDATE](#)), but in the opposite order. A deadlock can also occur when such statements lock ranges of index records and **gaps**, with each transaction acquiring some locks but not others due to a timing issue.

For background information on how deadlocks are automatically detected and handled, see [Section 15.5.5.2, “Deadlock Detection and Rollback”](#). For tips on avoiding and recovering from deadlock conditions, see [Section 15.5.5.3, “How to Minimize and Handle Deadlocks”](#).

See Also [gap](#), [lock](#), [transaction](#).

#### deadlock detection

A mechanism that automatically detects when a **deadlock** occurs, and automatically **rolls back** one of the **transactions** involved (the **victim**). Deadlock detection can be disabled using the [innodb\\_deadlock\\_detect](#) configuration option.

See Also [deadlock](#), [rollback](#), [transaction](#), [victim](#).

#### delete

When [InnoDB](#) processes a [DELETE](#) statement, the rows are immediately marked for deletion and no longer are returned by queries. The storage is reclaimed sometime later, during the periodic garbage collection

---

known as the **purge** operation. For removing large quantities of data, related operations with their own performance characteristics are **TRUNCATE** and **DROP**.

See Also [drop](#), [purge](#), [truncate](#).

#### delete buffering

The technique of storing changes to secondary index pages, resulting from [DELETE](#) operations, in the **change buffer** rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally marks an index record for deletion.) It is one of the types of **change buffering**; the others are **insert buffering** and **purge buffering**.

See Also [change buffer](#), [change buffering](#), [insert buffer](#), [insert buffering](#), [purge buffering](#).

#### denormalized

A data storage strategy that duplicates data across different tables, rather than linking the tables with **foreign keys** and **join** queries. Typically used in **data warehouse** applications, where the data is not updated after loading. In such applications, query performance is more important than making it simple to maintain consistent data during updates. Contrast with **normalized**.

See Also [data warehouse](#), [foreign key](#), [join](#), [normalized](#).

#### descending index

A type of **index** available with some database systems, where index storage is optimized to process [ORDER BY column DESC](#) clauses. Currently, although MySQL allows the [DESC](#) keyword in the [CREATE TABLE](#) statement, it does not use any special storage layout for the resulting index.

See Also [index](#).

#### dirty page

A **page** in the [InnoDB buffer pool](#) that has been updated in memory, where the changes are not yet written (**flushed**) to the **data files**. The opposite of a **clean page**.

See Also [buffer pool](#), [clean page](#), [data files](#), [flush](#), [page](#).

#### dirty read

An operation that retrieves unreliable data, data that was updated by another transaction but not yet **committed**. It is only possible with the **isolation level** known as **read uncommitted**.

This kind of operation does not adhere to the **ACID** principle of database design. It is considered very risky, because the data could be **rolled back**, or updated further before being committed; then, the transaction doing the dirty read would be using data that was never confirmed as accurate.

Its opposite is **consistent read**, where [InnoDB](#) ensures that a transaction does not read information updated by another transaction, even if the other transaction commits in the meantime.

See Also [ACID](#), [commit](#), [consistent read](#), [isolation level](#), [READ UNCOMMITTED](#), [rollback](#).

#### disk-based

A kind of database that primarily organizes data on disk storage (hard drives or equivalent). Data is brought back and forth between disk and memory to be operated upon. It is the opposite of an **in-memory database**. Although [InnoDB](#) is disk-based, it also contains features such as the **buffer pool**, multiple buffer pool instances, and the **adaptive hash index** that allow certain kinds of workloads to work primarily from memory.

See Also [adaptive hash index](#), [buffer pool](#), [in-memory database](#).

#### disk-bound

A type of **workload** where the primary **bottleneck** is disk I/O. (Also known as **I/O-bound**.) Typically involves frequent writes to disk, or random reads of more data than can fit into the **buffer pool**.

See Also [bottleneck](#), [buffer pool](#), [workload](#).

#### DML

Data manipulation language, a set of **SQL** statements for performing [INSERT](#), [UPDATE](#), and [DELETE](#) operations. The [SELECT](#) statement is sometimes considered as a DML statement, because the [SELECT ... FOR UPDATE](#) form is subject to the same considerations for **locking** as [INSERT](#), [UPDATE](#), and [DELETE](#).

DML statements for an [InnoDB](#) table operate in the context of a **transaction**, so their effects can be **committed** or **rolled back** as a single unit.

---

Contrast with **DDL** and **DCL**.

See Also [commit](#), [DCL](#), [DDL](#), [locking](#), [rollback](#), [SQL](#), [transaction](#).

#### document id

In the [InnoDB full-text search](#) feature, a special column in the table containing the **FULLTEXT index**, to uniquely identify the document associated with each **ilist** value. Its name is `FTS_DOC_ID` (uppercase required). The column itself must be of `BIGINT UNSIGNED NOT NULL` type, with a unique index named `FTS_DOC_ID_INDEX`. Preferably, you define this column when creating the table. If [InnoDB](#) must add the column to the table while creating a **FULLTEXT** index, the indexing operation is considerably more expensive. See Also [full-text search](#), [FULLTEXT index](#), [ilist](#).

#### doublewrite buffer

[InnoDB](#) uses a file flush technique called doublewrite. Before writing **pages** to the **data files**, [InnoDB](#) first writes them to a contiguous area called the doublewrite buffer. Only after the write and the flush to the doublewrite buffer have completed, does [InnoDB](#) write the pages to their proper positions in the data file. If there is an operating system, storage subsystem, or `mysqld` process crash in the middle of a page write, [InnoDB](#) can later find a good copy of the page from the doublewrite buffer during **crash recovery**.

Although data is always written twice, the doublewrite buffer does not require twice as much I/O overhead or twice as many I/O operations. Data is written to the buffer itself as a large sequential chunk, with a single `fsync()` call to the operating system.

To turn off the doublewrite buffer, specify the option `innodb_doublewrite=0`.

See Also [crash recovery](#), [data files](#), [page](#), [purge](#).

#### drop

A kind of **DDL** operation that removes a schema object, through a statement such as `DROP TABLE` or `DROP INDEX`. It maps internally to an `ALTER TABLE` statement. From an [InnoDB](#) perspective, the performance considerations of such operations involve the time that the **data dictionary** is locked to ensure that interrelated objects are all updated, and the time to update memory structures such as the **buffer pool**. For a **table**, the drop operation has somewhat different characteristics than a **truncate** operation (`TRUNCATE TABLE` statement).

See Also [buffer pool](#), [data dictionary](#), [DDL](#), [table](#), [truncate](#).

#### dynamic row format

A row format introduced in the [InnoDB Plugin](#), available as part of the **Barracuda file format**. Because long variable-length column values are stored outside of the page that holds the row data, it is very efficient for rows that include large objects. Since the large fields are typically not accessed to evaluate query conditions, they are not brought into the **buffer pool** as often, resulting in fewer I/O operations and better utilization of cache memory.

As of MySQL 5.7.9, the default row format is defined by `innodb_default_row_format`, which has a default value of `DYNAMIC`.

For additional information about [InnoDB DYNAMIC](#) row format, see [Section 15.11.3, “DYNAMIC and COMPRESSED Row Formats”](#).

See Also [Barracuda](#), [buffer pool](#), [file format](#), [row format](#).

## E

#### early adopter

A stage similar to **beta**, when a software product is typically evaluated for performance, functionality, and compatibility in a non-mission-critical setting.

See Also [beta](#).

#### error log

A type of **log** showing information about MySQL startup and critical runtime errors and **crash** information. For details, see [Section 6.4.2, “The Error Log”](#).

See Also [crash](#), [log](#).

---

## eviction

The process of removing an item from a cache or other temporary storage area, such as the [InnoDB buffer pool](#). Often, but not always, uses the **LRU** algorithm to determine which item to remove. When a **dirty page** is evicted, its contents are **flushed** to disk, and any dirty **neighbor pages** might be flushed also.

See Also [buffer pool](#), [dirty page](#), [flush](#), [LRU](#), [neighbor page](#).

## exclusive lock

A kind of **lock** that prevents any other **transaction** from locking the same row. Depending on the transaction **isolation level**, this kind of lock might block other transactions from writing to the same row, or might also block other transactions from reading the same row. The default [InnoDB](#) isolation level, **REPEATABLE READ**, enables higher **concurrency** by allowing transactions to read rows that have exclusive locks, a technique known as **consistent read**.

See Also [concurrency](#), [consistent read](#), [isolation level](#), [lock](#), [REPEATABLE READ](#), [shared lock](#), [transaction](#).

## extent

A group of **pages** within a **tablespace**. For the default **page size** of 16KB, an extent contains 64 pages. In MySQL 5.6, the page size for an [InnoDB](#) instance can be 4KB, 8KB, or 16KB, controlled by the [innodb\\_page\\_size](#) configuration option. For 4KB, 8KB, and 16KB pages sizes, the extent size is always 1MB (or 1048576 bytes).

Support for 32KB and 64KB [InnoDB](#) page sizes was added in MySQL 5.7.6. For a 32KB page size, the extent size is 2MB. For a 64KB page size, the extent size is 4MB.

[InnoDB](#) features such as **segments**, **read-ahead** requests and the **doublewrite buffer** use I/O operations that read, write, allocate, or free data one extent at a time.

See Also [doublewrite buffer](#), [page](#), [page size](#), [read-ahead](#), [segment](#), [tablespace](#).

# F

## .frm file

A file containing the metadata, such as the table definition, of a MySQL table.

For backups, you must always keep the full set of [.frm](#) files along with the backup data to be able to restore tables that are altered or dropped after the backup.

Although each [InnoDB](#) table has a [.frm](#) file, [InnoDB](#) maintains its own table metadata in the **system tablespace**; the [.frm](#) files are not needed for [InnoDB](#) to operate on [InnoDB](#) tables.

[.frm](#) files are backed up by the **MySQL Enterprise Backup** product. These files must not be modified by an [ALTER TABLE](#) operation while the backup is taking place, which is why backups that include non-[InnoDB](#) tables perform a [FLUSH TABLES WITH READ LOCK](#) operation to freeze such activity while backing up [.frm](#) files. Restoring a backup can result in [.frm](#) files being created, changed, or removed to match the state of the database at the time of the backup.

See Also [data dictionary](#), [MySQL Enterprise Backup](#), [system tablespace](#).

## Fast Index Creation

A capability first introduced in the [InnoDB](#) Plugin, now part of MySQL in 5.5 and higher, that speeds up creation of [InnoDB](#) **secondary indexes** by avoiding the need to completely rewrite the associated table. The speedup applies to dropping secondary indexes also.

Because index maintenance can add performance overhead to many data transfer operations, consider doing operations such as [ALTER TABLE ... ENGINE=INNODB](#) or [INSERT INTO ... SELECT \\* FROM ...](#) without any secondary indexes in place, and creating the indexes afterward.

In MySQL 5.6, this feature becomes more general. You can read and write to tables while an index is being created, and many more kinds of [ALTER TABLE](#) operations can be performed without copying the table, without blocking **DML** operations, or both. Thus in MySQL 5.6 and higher, this set of features is referred to as **online DDL** rather than Fast Index Creation.

For related information, see [InnoDB Fast Index Creation](#), and [Section 15.13, “InnoDB and Online DDL”](#).

See Also [DML](#), [index](#), [online DDL](#), [secondary index](#).

---

## fast shutdown

The default **shutdown** procedure for [InnoDB](#), based on the configuration setting [innodb\\_fast\\_shutdown=1](#). To save time, certain **flush** operations are skipped. This type of shutdown is safe during normal usage, because the flush operations are performed during the next startup, using the same mechanism as in **crash recovery**. In cases where the database is being shut down for an upgrade or downgrade, do a **slow shutdown** instead to ensure that all relevant changes are applied to the **data files** during the shutdown.

See Also [crash recovery](#), [data files](#), [flush](#), [shutdown](#), [slow shutdown](#).

## file format

The file format for [InnoDB](#) tables, enabled using the [innodb\\_file\\_format](#) configuration option. Supported file formats are **Antelope** and **Barracuda**. Antelope is the original [InnoDB](#) file format and supports the **REDUNDANT** and **COMPACT** row formats. Barracuda is the newer [InnoDB](#) file format and supports the **COMPRESSED** and **DYNAMIC** row formats.

See Also [Antelope](#), [Barracuda](#), [file-per-table](#), [.ibd file](#), [ibdata file](#), [row format](#).

## file-per-table

A general name for the setting controlled by the [innodb\\_file\\_per\\_table](#) option, which is an important configuration option that affects aspects of [InnoDB](#) file storage, availability of features, and I/O characteristics. As of MySQL 5.6.7, [innodb\\_file\\_per\\_table](#) is enabled by default.

With the [innodb\\_file\\_per\\_table](#) option enabled, you can create a table in its own **.ibd file** rather than in the shared **ibdata files** of the **system tablespace**. When table data is stored in an individual **.ibd file**, you have more flexibility to choose **row formats** required for features such as data **compression**. The [TRUNCATE TABLE](#) operation is also faster, and reclaimed space can be used by the operating system rather than remaining reserved for [InnoDB](#).

The **MySQL Enterprise Backup** product is more flexible for tables that are in their own files. For example, tables can be excluded from a backup, but only if they are in separate files. Thus, this setting is suitable for tables that are backed up less frequently or on a different schedule.

See Also [compressed row format](#), [compression](#), [file format](#), [.ibd file](#), [ibdata file](#), [innodb\\_file\\_per\\_table](#), [MySQL Enterprise Backup](#), [row format](#), [system tablespace](#).

## fill factor

In an [InnoDB index](#), the proportion of a **page** that is taken up by index data before the page is split. The unused space when index data is first divided between pages allows for rows to be updated with longer string values without requiring expensive index maintenance operations. If the fill factor is too low, the index consumes more space than needed, causing extra I/O overhead when reading the index. If the fill factor is too high, any update that increases the length of column values can cause extra I/O overhead for index maintenance. See [Section 15.8.11, “Physical Structure of an InnoDB Index”](#) for more information.

See Also [index](#), [page](#).

## fixed row format

This row format is used by the [MyISAM](#) storage engine, not by [InnoDB](#). If you create an [InnoDB](#) table with the option [ROW\\_FORMAT=FIXED](#) in MySQL 5.7.6 or earlier, [InnoDB](#) uses the **compact row format** instead, although the **FIXED** value might still show up in output such as [SHOW TABLE STATUS](#) reports. As of MySQL 5.7.7, [InnoDB](#) returns an error if [ROW\\_FORMAT=FIXED](#) is specified.

See Also [compact row format](#), [row format](#).

## flush

To write changes to the database files, that had been buffered in a memory area or a temporary disk storage area. The [InnoDB](#) storage structures that are periodically flushed include the **redo log**, the **undo log**, and the **buffer pool**.

Flushing can happen because a memory area becomes full and the system needs to free some space, because a **commit** operation means the changes from a transaction can be finalized, or because a **slow shutdown** operation means that all outstanding work should be finalized. When it is not critical to flush all the buffered data at once, [InnoDB](#) can use a technique called **fuzzy checkpointing** to flush small batches of pages to spread out the I/O overhead.

---

See Also [buffer pool](#), [commit](#), [fuzzy checkpointing](#), [redo log](#), [slow shutdown](#), [undo log](#).

#### flush list

An internal [InnoDB](#) data structure that tracks **dirty pages** in the **buffer pool**: that is, **pages** that have been changed and need to be written back out to disk. This data structure is updated frequently by [InnoDB](#) internal **mini-transactions**, and so is protected by its own **mutex** to allow concurrent access to the buffer pool.

See Also [buffer pool](#), [dirty page](#), [LRU](#), [mini-transaction](#), [mutex](#), [page](#), [page cleaner](#).

#### foreign key

A type of pointer relationship, between rows in separate [InnoDB](#) tables. The foreign key relationship is defined on one column in both the **parent table** and the **child table**.

In addition to enabling fast lookup of related information, foreign keys help to enforce **referential integrity**, by preventing any of these pointers from becoming invalid as data is inserted, updated, and deleted. This enforcement mechanism is a type of **constraint**. A row that points to another table cannot be inserted if the associated foreign key value does not exist in the other table. If a row is deleted or its foreign key value changed, and rows in another table point to that foreign key value, the foreign key can be set up to prevent the deletion, cause the corresponding column values in the other table to become **null**, or automatically delete the corresponding rows in the other table.

One of the stages in designing a **normalized** database is to identify data that is duplicated, separate that data into a new table, and set up a foreign key relationship so that the multiple tables can be queried like a single table, using a **join** operation.

See Also [child table](#), [FOREIGN KEY constraint](#), [join](#), [normalized](#), [NULL](#), [parent table](#), [referential integrity](#), [relational](#).

#### FOREIGN KEY constraint

The type of **constraint** that maintains database consistency through a **foreign key** relationship. Like other kinds of constraints, it can prevent data from being inserted or updated if data would become inconsistent; in this case, the inconsistency being prevented is between data in multiple tables. Alternatively, when a **DML** operation is performed, [FOREIGN KEY](#) constraints can cause data in **child rows** to be deleted, changed to different values, or set to **null**, based on the [ON CASCADE](#) option specified when creating the foreign key.

See Also [child table](#), [constraint](#), [DML](#), [foreign key](#), [NULL](#).

#### FTS

In most contexts, an acronym for **full-text search**. Sometimes in performance discussions, an acronym for **full table scan**.

See Also [full table scan](#), [full-text search](#).

#### full backup

A **backup** that includes all the **tables** in each MySQL **database**, and all the databases in a MySQL **instance**. Contrast with **partial backup**.

See Also [backup](#), [database](#), [instance](#), [partial backup](#), [table](#).

#### full table scan

An operation that requires reading the entire contents of a table, rather than just selected portions using an **index**. Typically performed either with small lookup tables, or in data warehousing situations with large tables where all available data is aggregated and analyzed. How frequently these operations occur, and the sizes of the tables relative to available memory, have implications for the algorithms used in query optimization and managing the **buffer pool**.

The purpose of indexes is to allow lookups for specific values or ranges of values within a large table, thus avoiding full table scans when practical.

See Also [buffer pool](#), [index](#).

#### full-text search

The MySQL feature for finding words, phrases, Boolean combinations of words, and so on within table data, in a faster, more convenient, and more flexible way than using the SQL [LIKE](#) operator or writing your own application-level search algorithm. It uses the SQL function [MATCH\(\)](#) and **FULLTEXT indexes**.

See Also [FULLTEXT index](#).

---

## FULLTEXT index

The special kind of **index** that holds the **search index** in the MySQL **full-text search** mechanism.

Represents the words from values of a column, omitting any that are specified as **stopwords**. Originally, only available for **MyISAM** tables. Starting in MySQL 5.6.4, it is also available for **InnoDB** tables.

See Also [full-text search](#), [index](#), [InnoDB](#), [search index](#), [stopword](#).

## fuzzy checkpointing

A technique that **flushes** small batches of **dirty pages** from the **buffer pool**, rather than flushing all dirty pages at once which would disrupt database processing.

See Also [buffer pool](#), [dirty page](#), [flush](#).

# G

## GA

“Generally available”, the stage when a software product leaves **beta** and is available for sale, official support, and production use.

See Also [beta](#).

## gap

A place in an **InnoDB index** data structure where new values could be inserted. When you lock a set of rows with a statement such as `SELECT ... FOR UPDATE`, **InnoDB** can create locks that apply to the gaps as well as the actual values in the index. For example, if you select all values greater than 10 for update, a gap lock prevents another transaction from inserting a new value that is greater than 10. The **supremum record** and **infimum record** represent the gaps containing all values greater than or less than all the current index values.

See Also [concurrency](#), [gap lock](#), [index](#), [infimum record](#), [isolation level](#), [supremum record](#).

## gap lock

A **lock** on a **gap** between index records, or a lock on the gap before the first or after the last index record. For example, `SELECT c1 FROM t WHERE c1 BETWEEN 10 and 20 FOR UPDATE;` prevents other transactions from inserting a value of 15 into the column `t.c1`, whether or not there was already any such value in the column, because the gaps between all existing values in the range are locked. Contrast with **record lock** and **next-key lock**.

Gap locks are part of the tradeoff between performance and **concurrency**, and are used in some transaction **isolation levels** and not others.

See Also [gap](#), [infimum record](#), [lock](#), [next-key lock](#), [record lock](#), [supremum record](#).

## general log

See [general query log](#).

## general query log

A type of **log** used for diagnosis and troubleshooting of SQL statements processed by the MySQL server. Can be stored in a file or in a database table. You must enable this feature through the [general\\_log](#) configuration option to use it. You can disable it for a specific connection through the [sql\\_log\\_off](#) configuration option.

Records a broader range of queries than the **slow query log**. Unlike the **binary log**, which is used for replication, the general query log contains `SELECT` statements and does not maintain strict ordering. For more information, see [Section 6.4.3, “The General Query Log”](#).

See Also [binary log](#), [log](#), [slow query log](#).

## general tablespace

A shared **InnoDB tablespace** created using `CREATE TABLESPACE` syntax. General tablespaces can be created outside of the MySQL data directory, are capable of holding multiple **tables**, and support tables of all row formats. General tablespaces were introduced in MySQL 5.7.6.

Tables are added to a general tablespace using `CREATE TABLE tbl_name ... TABLESPACE [=] tablespace_name` or `ALTER TABLE tbl_name TABLESPACE [=] tablespace_name` syntax.

Contrast with **system tablespace** and **file-per-table** tablespace.

---

For more information, see [Section 15.7.9, “InnoDB General Tablespaces”](#).  
See Also [file-per-table](#), [system tablespace](#), [table](#), [tablespace](#).

#### generated column

A column whose values are computed from an expression included in the column definition. A generated column can be **virtual** or **stored**.

See Also [base column](#), [generated stored column](#), [generated virtual column](#).

#### generated stored column

A column whose values are computed from an expression included in the column definition. Column values are evaluated and stored when rows are inserted or updated. A stored column requires storage space and can be indexed.

Contrast with **generated virtual column**.

See Also [base column](#), [generated column](#), [generated virtual column](#).

#### generated virtual column

A column whose values are computed from an expression included in the column definition. Column values are not stored, but are evaluated when rows are read, immediately after any **BEFORE** triggers. A virtual column takes no storage. [InnoDB](#) supports secondary indexes on generated virtual columns.

Contrast with **generated stored column**.

See Also [base column](#), [generated column](#), [generated stored column](#).

#### global transaction

A type of **transaction** involved in **XA** operations. It consists of several actions that are transactional in themselves, but that all must either complete successfully as a group, or all be rolled back as a group. In essence, this extends **ACID** properties “up a level” so that multiple ACID transactions can be executed in concert as components of a global operation that also has ACID properties.

See Also [ACID](#), [transaction](#), [XA](#).

#### group commit

An [InnoDB](#) optimization that performs some low-level I/O operations (log write) once for a set of **commit** operations, rather than flushing and syncing separately for each commit.

When the **binary log** is enabled, you typically also set the configuration option `sync_binlog=0`, because group commit for the binary log is only supported if it is set to 0.

See Also [binary log](#), [commit](#).

## H

#### hash index

A type of **index** intended for queries that use equality operators, rather than range operators such as greater-than or **BETWEEN**. It is available for [MEMORY](#) tables. Although hash indexes are the default for [MEMORY](#) tables for historic reasons, that storage engine also supports **B-tree** indexes, which are often a better choice for general-purpose queries.

MySQL includes a variant of this index type, the **adaptive hash index**, that is constructed automatically for [InnoDB](#) tables if needed based on runtime conditions.

See Also [adaptive hash index](#), [B-tree](#), [index](#), [InnoDB](#).

#### HDD

Acronym for “hard disk drive”. Refers to storage media using spinning platters, usually when comparing and contrasting with **SSD**. Its performance characteristics can influence the throughput of a **disk-based** workload.

See Also [disk-based](#), [SSD](#).

#### heartbeat

A periodic message that is sent to indicate that a system is functioning properly. In a **replication** context, if the **master** stops sending such messages, one of the **slaves** can take its place. Similar techniques can be used between the servers in a cluster environment, to confirm that all of them are operating properly.

---

See Also [master server](#), [replication](#).

#### high-water mark

A value representing an upper limit, either a hard limit that should not be exceeded at runtime, or a record of the maximum value that was actually reached. Contrast with **low-water mark**.

See Also [low-water mark](#).

#### history list

A list of **transactions** with delete-marked records scheduled to be processed by the [InnoDB purge](#) operation. Recorded in the **undo log**. The length of the history list is reported by the command [SHOW ENGINE INNODB STATUS](#). If the history list grows longer than the value of the [innodb\\_max\\_purge\\_lag](#) configuration option, each **DML** operation is delayed slightly to allow the purge operation to finish **flushing** the deleted records.

Also known as **purge lag**.

See Also [DML](#), [flush](#), [purge](#), [purge lag](#), [rollback segment](#), [transaction](#), [undo log](#).

#### hole punching

Releasing empty blocks from a page. The [InnoDB transparent page compression](#) feature relies on hole punching support. For more information, see [Section 15.9.2, “InnoDB Page Compression”](#).

See Also [sparse file](#), [transparent page compression](#).

#### hot

A condition where a row, table, or internal data structure is accessed so frequently, requiring some form of locking or mutual exclusion, that it results in a performance or scalability issue.

Although “hot” typically indicates an undesirable condition, a **hot backup** is the preferred type of backup.

See Also [hot backup](#).

#### hot backup

A backup taken while the database is running and applications are reading and writing to it. The backup involves more than simply copying data files: it must include any data that was inserted or updated while the backup was in process; it must exclude any data that was deleted while the backup was in process; and it must ignore any changes that were not committed.

The Oracle product that performs hot backups, of [InnoDB](#) tables especially but also tables from [MyISAM](#) and other storage engines, is known as **MySQL Enterprise Backup**.

The hot backup process consists of two stages. The initial copying of the data files produces a **raw backup**. The **apply** step incorporates any changes to the database that happened while the backup was running. Applying the changes produces a **prepared** backup; these files are ready to be restored whenever necessary. See Also [apply](#), [MySQL Enterprise Backup](#), [prepared backup](#), [raw backup](#).

## I

#### .ibd file

The data file for **file-per-table** tablespaces and general tablespaces. File-per-table tablespace [.idb](#) files contain a single table and associated index data. **General tablespace** [.idb](#) files may contain table and index data for multiple tables. General tablespaces were introduced in MySQL 5.7.6.

The [.ibd](#) file extension does not apply to the **system tablespace**, which consists of one or more **ibdata files**.

If a file-per-table tablespace or general tablespace is created with the [DATA DIRECTORY =](#) clause, the [.ibd](#) file is located at the specified path, outside the normal data directory, and is pointed to by a [.isl](#) file.

When a [.ibd](#) file is included in a compressed backup by the **MySQL Enterprise Backup** product, the compressed equivalent is a [.ibz](#) file.

See Also [database](#), [file-per-table](#), [general tablespace](#), [ibdata file](#), [.ibz file](#), [innodb\\_file\\_per\\_table](#), [.isl file](#), [MySQL Enterprise Backup](#), [system tablespace](#).

---

#### .ibz file

When the **MySQL Enterprise Backup** product performs a **compressed backup**, it transforms each **tablespace** file that is created using the **file-per-table** setting from a **.ibd** extension to a **.ibz** extension.

The compression applied during backup is distinct from the **compressed row format** that keeps table data compressed during normal operation. A compressed backup operation skips the compression step for a tablespace that is already in compressed row format, as compressing a second time would slow down the backup but produce little or no space savings.

See Also [compressed backup](#), [compressed row format](#), [file-per-table](#), [.ibd file](#), [MySQL Enterprise Backup](#), [tablespace](#).

#### .isl file

A file that specifies the location of an **.ibd** file for an **InnoDB** table created with the **DATA DIRECTORY =** clause in MySQL 5.6 and higher, or with the **CREATE TABLESPACE ... ADD DATAFILE** clause in MySQL 5.7.8 and higher. It functions like a symbolic link, without the platform restrictions of the actual symbolic link mechanism. You can store **InnoDB tablespaces** outside the **database** directory, for example, on an especially large or fast storage device depending on the usage of the table. For details, see [Section 15.7.5, “Creating a File-Per-Table Tablespace Outside the Data Directory”](#), and [Section 15.7.9, “InnoDB General Tablespaces”](#).

See Also [database](#), [.ibd file](#), [table](#), [tablespace](#).

#### I/O-bound

See [disk-bound](#).

#### ib-file set

The set of files managed by **InnoDB** within a MySQL database: the **system tablespace**, **file-per-table** tablespace files, and **redo log** files. Depending on MySQL version and **InnoDB** configuration, may also include **general tablespace**, **temporary tablespace**, and **undo tablespace** files. This term is sometimes used in detailed discussions of **InnoDB** file structures and formats to refer to the set of files managed by **InnoDB** within a MySQL database.

See Also [database](#), [file-per-table](#), [general tablespace](#), [redo log](#), [system tablespace](#), [temporary tablespace](#), [undo tablespace](#).

#### ibbackup\_logfile

A supplemental backup file created by the **MySQL Enterprise Backup** product during a **hot backup** operation. It contains information about any data changes that occurred while the backup was running. The initial backup files, including **ibbackup\_logfile**, are known as a **raw backup**, because the changes that occurred during the backup operation are not yet incorporated. After you perform the **apply** step to the raw backup files, the resulting files do include those final data changes, and are known as a **prepared backup**. At this stage, the **ibbackup\_logfile** file is no longer necessary.

See Also [apply](#), [hot backup](#), [MySQL Enterprise Backup](#), [prepared backup](#), [raw backup](#).

#### ibdata file

A set of files with names such as **ibdata1**, **ibdata2**, and so on, that make up the **InnoDB system tablespace**. These files contain metadata about **InnoDB** tables, (the **InnoDB data dictionary**), and the storage areas for one or more **undo logs**, the **change buffer**, and the **doublewrite buffer**. They also can contain some or all of the table data also (depending on whether the **file-per-table** mode is in effect when each table is created). When the **innodb\_file\_per\_table** option is enabled, data and indexes for newly created tables are stored in separate **.ibd** files rather than in the system tablespace.

The growth of the **ibdata** files is influenced by the **innodb\_autoextend\_increment** configuration option. See Also [change buffer](#), [data dictionary](#), [doublewrite buffer](#), [file-per-table](#), [.ibd file](#), [innodb\\_file\\_per\\_table](#), [system tablespace](#), [undo log](#).

#### ibtmp file

The **InnoDB temporary tablespace data file** for non-compressed **InnoDB temporary tables** and related objects. The configuration file option, **innodb\_temp\_data\_file\_path**, allows users to define a relative path for the temporary tablespace data file. If **innodb\_temp\_data\_file\_path** is not specified, the default behavior is to create a single auto-extending 12MB data file named **ibtmp1** in the data directory, alongside **ibdata1**.

---

See Also [data files](#), [temporary table](#), [temporary tablespace](#).

#### ib\_logfile

A set of files, typically named `ib_logfile0` and `ib_logfile1`, that form the **redo log**. Also sometimes referred to as the **log group**. These files record statements that attempt to change data in [InnoDB](#) tables. These statements are replayed automatically to correct data written by incomplete transactions, on startup following a crash.

This data cannot be used for manual recovery; for that type of operation, use the **binary log**.

See Also [binary log](#), [log group](#), [redo log](#).

#### ilist

Within an [InnoDB FULLTEXT index](#), the data structure consisting of a document ID and positional information for a token (that is, a particular word).

See Also [FULLTEXT index](#).

#### implicit row lock

A row lock that [InnoDB](#) acquires to ensure consistency, without you specifically requesting it.

See Also [row lock](#).

#### in-memory database

A type of database system that maintains data in memory, to avoid overhead due to disk I/O and translation between disk blocks and memory areas. Some in-memory databases sacrifice durability (the “D” in the **ACID** design philosophy) and are vulnerable to hardware, power, and other types of failures, making them more suitable for read-only operations. Other in-memory databases do use durability mechanisms such as logging changes to disk or using non-volatile memory.

MySQL features that address the same kinds of memory-intensive processing include the [InnoDB buffer pool](#), **adaptive hash index**, and **read-only transaction** optimization, the [MEMORY](#) storage engine, the [MyISAM](#) key cache, and the MySQL query cache.

See Also [ACID](#), [adaptive hash index](#), [buffer pool](#), [disk-based](#), [read-only transaction](#).

#### incremental backup

A type of **hot backup**, performed by the **MySQL Enterprise Backup** product, that only saves data changed since some point in time. Having a full backup and a succession of incremental backups lets you reconstruct backup data over a long period, without the storage overhead of keeping several full backups on hand. You can restore the full backup and then apply each of the incremental backups in succession, or you can keep the full backup up-to-date by applying each incremental backup to it, then perform a single restore operation.

The granularity of changed data is at the **page** level. A page might actually cover more than one row. Each changed page is included in the backup.

See Also [hot backup](#), [MySQL Enterprise Backup](#), [page](#).

#### index

A data structure that provides a fast lookup capability for **rows** of a **table**, typically by forming a tree structure (**B-tree**) representing all the values of a particular **column** or set of columns.

[InnoDB](#) tables always have a **clustered index** representing the **primary key**. They can also have one or more **secondary indexes** defined on one or more columns. Depending on their structure, secondary indexes can be classified as **partial**, **column**, or **composite** indexes.

Indexes are a crucial aspect of **query** performance. Database architects design tables, queries, and indexes to allow fast lookups for data needed by applications. The ideal database design uses a **covering index** where practical; the query results are computed entirely from the index, without reading the actual table data. Each **foreign key** constraint also requires an index, to efficiently check whether values exist in both the **parent** and **child** tables.

Although a B-tree index is the most common, a different kind of data structure is used for **hash indexes**, as in the [MEMORY](#) storage engine and the [InnoDB adaptive hash index](#). **R-tree** indexes are used for spatial indexing of multi-dimensional information.

---

See Also [adaptive hash index](#), [B-tree](#), [child table](#), [clustered index](#), [column index](#), [composite index](#), [covering index](#), [foreign key](#), [hash index](#), [parent table](#), [partial index](#), [primary key](#), [query](#), [R-tree](#), [row](#), [secondary index](#), [table](#).

#### index cache

A memory area that holds the token data for [InnoDB full-text search](#). It buffers the data to minimize disk I/O when data is inserted or updated in columns that are part of a **FULLTEXT index**. The token data is written to disk when the index cache becomes full. Each [InnoDB FULLTEXT](#) index has its own separate index cache, whose size is controlled by the configuration option `innodb_ft_cache_size`.

See Also [full-text search](#), [FULLTEXT index](#).

#### index condition pushdown

Index condition pushdown (ICP) is an optimization that pushes part of a [WHERE](#) condition down to the storage engine if parts of the condition can be evaluated using fields from the **index**. ICP can reduce the number of times the **storage engine** must access the base table and the number of times the MySQL server must access the storage engine. For more information, see [Section 9.2.1.6, “Index Condition Pushdown Optimization”](#).

See Also [index](#), [storage engine](#).

#### index hint

Extended SQL syntax for overriding the **indexes** recommended by the optimizer. For example, the [FORCE INDEX](#), [USE INDEX](#), and [IGNORE INDEX](#) clauses. Typically used when indexed columns have unevenly distributed values, resulting in inaccurate **cardinality** estimates.

See Also [cardinality](#), [index](#).

#### index prefix

In an **index** that applies to multiple columns (known as a **composite index**), the initial or leading columns of the index. A query that references the first 1, 2, 3, and so on columns of a composite index can use the index, even if the query does not reference all the columns in the index.

See Also [composite index](#), [index](#).

#### index statistics

See [statistics](#).

#### infimum record

A **pseudo-record** in an **index**, representing the **gap** below the smallest value in that index. If a transaction has a statement such as `SELECT ... FROM ... WHERE col < 10 FOR UPDATE;`, and the smallest value in the column is 5, it is a lock on the infimum record that prevents other transactions from inserting even smaller values such as 0, -10, and so on.

See Also [gap](#), [index](#), [pseudo-record](#), [supremum record](#).

#### INFORMATION\_SCHEMA

The name of the **database** that provides a query interface to the MySQL **data dictionary**. (This name is defined by the ANSI SQL standard.) To examine information (metadata) about the database, you can query tables such as [INFORMATION\\_SCHEMA.TABLES](#) and [INFORMATION\\_SCHEMA.COLUMNS](#), rather than using [SHOW](#) commands that produce unstructured output.

The [INFORMATION\\_SCHEMA](#) database also contains tables specific to **InnoDB** that provide a query interface to the [InnoDB](#) data dictionary. You use these tables not to see how the database is structured, but to get real-time information about the workings of [InnoDB](#) tables to help with performance monitoring, tuning, and troubleshooting.

See Also [data dictionary](#), [database](#), [InnoDB](#).

#### InnoDB

A MySQL component that combines high performance with **transactional** capability for reliability, robustness, and concurrent access. It embodies the **ACID** design philosophy. Represented as a **storage engine**; it handles tables created or altered with the [ENGINE=INNODB](#) clause. See [Chapter 15, The InnoDB Storage Engine](#) for architectural details and administration procedures, and [Section 9.5, “Optimizing for InnoDB Tables”](#) for performance advice.

---

In MySQL 5.5 and higher, [InnoDB](#) is the default storage engine for new tables and the `ENGINE=INNODB` clause is not required.

[InnoDB](#) tables are ideally suited for **hot backups**. See [Section 28.2, “MySQL Enterprise Backup Overview”](#) for information about the **MySQL Enterprise Backup** product for backing up MySQL servers without interrupting normal processing.

See Also [ACID](#), [hot backup](#), [MySQL Enterprise Backup](#), [storage engine](#), [transaction](#).

#### `innodb_autoinc_lock_mode`

The `innodb_autoinc_lock_mode` option controls the algorithm used for **auto-increment locking**. When you have an auto-incrementing **primary key**, you can use statement-based replication only with the setting `innodb_autoinc_lock_mode=1`. This setting is known as *consecutive* lock mode, because multi-row inserts within a transaction receive consecutive auto-increment values. If you have `innodb_autoinc_lock_mode=2`, which allows higher concurrency for insert operations, use row-based replication rather than statement-based replication. This setting is known as *interleaved* lock mode, because multiple multi-row insert statements running at the same time can receive **auto-increment** values that are interleaved. The setting `innodb_autoinc_lock_mode=0` is the previous (traditional) default setting and should not be used except for compatibility purposes.

See Also [auto-increment](#), [auto-increment locking](#), [mixed-mode insert](#), [primary key](#).

#### `innodb_file_format`

The `innodb_file_format` option defines the **file format** to use for new [InnoDB](#) file-per-table **tablespaces**. Currently, you can specify the **Antelope** and **Barracuda** file formats.

See Also [Antelope](#), [Barracuda](#), [file format](#), [file-per-table](#), [general tablespace](#), [innodb\\_file\\_per\\_table](#), [system tablespace](#), [tablespace](#).

#### `innodb_file_per_table`

An important configuration option that affects many aspects of [InnoDB](#) file storage, availability of features, and I/O characteristics. In MySQL 5.6.7 and higher, it is enabled by default. The `innodb_file_per_table` option turns on **file-per-table** mode. With this mode enabled, a newly created [InnoDB](#) table and associated indexes can be stored in a file-per-table **.ibd file**, outside the **system tablespace**.

This option affects the performance and storage considerations for a number of SQL statements, such as `DROP TABLE` and `TRUNCATE TABLE`.

Enabling the `innodb_file_per_table` option allows you to take advantage of features such as table **compression** and named-table backups in **MySQL Enterprise Backup**.

For more information, see `innodb_file_per_table`, and [Section 15.7.4, “InnoDB File-Per-Table Tablespaces”](#).

See Also [compression](#), [file-per-table](#), [.ibd file](#), [MySQL Enterprise Backup](#), [system tablespace](#).

#### `innodb_lock_wait_timeout`

The `innodb_lock_wait_timeout` option sets the balance between **waiting** for shared resources to become available, or giving up and handling the error, retrying, or doing alternative processing in your application. Rolls back any [InnoDB](#) transaction that waits more than a specified time to acquire a **lock**. Especially useful if **deadlocks** are caused by updates to multiple tables controlled by different storage engines; such deadlocks are not **detected** automatically.

See Also [deadlock](#), [deadlock detection](#), [lock](#), [wait](#).

#### `innodb_strict_mode`

The `innodb_strict_mode` option controls whether [InnoDB](#) operates in **strict mode**, where conditions that are normally treated as warnings, cause errors instead (and the underlying statements fail).

See Also [strict mode](#).

#### `insert`

One of the primary **DML** operations in **SQL**. The performance of inserts is a key factor in **data warehouse** systems that load millions of rows into tables, and **OLTP** systems where many concurrent connections might insert rows into the same table, in arbitrary order. If insert performance is important to you, you should learn about [InnoDB](#) features such as the **insert buffer** used in **change buffering**, and **auto-increment** columns.

---

See Also [auto-increment](#), [change buffering](#), [data warehouse](#), [DML](#), [InnoDB](#), [insert buffer](#), [OLTP](#), [SQL](#).

#### insert buffer

The former name of the **change buffer**. In MySQL 5.5, support was added for buffering changes to secondary index pages for [DELETE](#) and [UPDATE](#) operations. Previously, only changes resulting from [INSERT](#) operations were buffered. The preferred term is now *change buffer*.

See Also [change buffer](#), [change buffering](#).

#### insert buffering

The technique of storing changes to secondary index pages, resulting from [INSERT](#) operations, in the **change buffer** rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. It is one of the types of **change buffering**; the others are **delete buffering** and **purge buffering**.

Insert buffering is not used if the secondary index is **unique**, because the uniqueness of new values cannot be verified before the new entries are written out. Other kinds of change buffering do work for unique indexes. See Also [change buffer](#), [change buffering](#), [delete buffering](#), [insert buffer](#), [purge buffering](#), [unique index](#).

#### insert intention lock

A type of **gap lock** that is set by [INSERT](#) operations prior to row insertion. This type of **lock** signals the intent to insert in such a way that multiple transactions inserting into the same index gap need not wait for each other if they are not inserting at the same position within the gap. For more information, see [Section 15.5.1, “InnoDB Locking”](#).

See Also [gap lock](#), [lock](#), [next-key lock](#).

#### instance

A single **mysqld** daemon managing a **data directory** representing one or more **databases** with a set of **tables**. It is common in development, testing, and some **replication** scenarios to have multiple instances on the same **server** machine, each managing its own data directory and listening on its own port or socket. With one instance running a **disk-bound** workload, the server might still have extra CPU and memory capacity to run additional instances.

See Also [data directory](#), [database](#), [disk-bound](#), [mysqld](#), [replication](#), [server](#), [table](#).

#### instrumentation

Modifications at the source code level to collect performance data for tuning and debugging. In MySQL, data collected by instrumentation is exposed through an SQL interface using the [INFORMATION\\_SCHEMA](#) and [PERFORMANCE\\_SCHEMA](#) databases.

See Also [INFORMATION\\_SCHEMA](#), [Performance Schema](#).

#### intention exclusive lock

See [intention lock](#).

#### intention lock

A kind of **lock** that applies to the table, used to indicate the kind of lock the **transaction** intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an *intention exclusive* (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an *intention shared* (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible. For more information about this locking mechanism, see [Section 15.5.1, “InnoDB Locking”](#).

See Also [lock](#), [lock mode](#), [locking](#), [transaction](#).

#### intention shared lock

See [intention lock](#).

#### inverted index

A data structure optimized for document retrieval systems, used in the implementation of [InnoDB full-text search](#). The [InnoDB FULLTEXT index](#), implemented as an inverted index, records the position of each word within a document, rather than the location of a table row. A single column value (a document stored as a text string) is represented by many entries in the inverted index.

---

See Also [full-text search](#), [FULLTEXT index](#), [ilist](#).

## IOPS

Acronym for **I/O operations per second**. A common measurement for busy systems, particularly **OLTP** applications. If this value is near the maximum that the storage devices can handle, the application can become **disk-bound**, limiting **scalability**.

See Also [disk-bound](#), [OLTP](#), [scalability](#).

## isolation level

One of the foundations of database processing. Isolation is the **I** in the acronym **ACID**; the isolation level is the setting that fine-tunes the balance between performance and reliability, consistency, and reproducibility of results when multiple **transactions** are making changes and performing queries at the same time.

From highest amount of consistency and protection to the least, the isolation levels supported by InnoDB are: **SERIALIZABLE**, **REPEATABLE READ**, **READ COMMITTED**, and **READ UNCOMMITTED**.

With [InnoDB](#) tables, many users can keep the default isolation level (*REPEATABLE READ*) for all operations. Expert users might choose the **READ COMMITTED** level as they push the boundaries of scalability with **OLTP** processing, or during data warehousing operations where minor inconsistencies do not affect the aggregate results of large amounts of data. The levels on the edges (**SERIALIZABLE** and **READ UNCOMMITTED**) change the processing behavior to such an extent that they are rarely used.

See Also [ACID](#), [OLTP](#), [READ COMMITTED](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

## J

### join

A **query** that retrieves data from more than one table, by referencing columns in the tables that hold identical values. Ideally, these columns are part of an [InnoDB](#) **foreign key** relationship, which ensures **referential integrity** and that the join columns are **indexed**. Often used to save space and improve query performance by replacing repeated strings with numeric IDs, in a **normalized** data design.

See Also [foreign key](#), [index](#), [normalized](#), [query](#), [referential integrity](#).

## K

### KEY\_BLOCK\_SIZE

An option to specify the size of data pages within an [InnoDB](#) table that uses **compressed row format**. The default is 8 kilobytes. Lower values risk hitting internal limits that depend on the combination of row size and compression percentage.

For [MyISAM](#) tables, [KEY\\_BLOCK\\_SIZE](#) optionally specifies the size in bytes to use for index key blocks. The value is treated as a hint; a different size could be used if necessary. A [KEY\\_BLOCK\\_SIZE](#) value specified for an individual index definition overrides a table-level [KEY\\_BLOCK\\_SIZE](#) value.

See Also [compressed row format](#).

## L

### latch

A lightweight structure used by [InnoDB](#) to implement a **lock** for its own internal memory structures, typically held for a brief time measured in milliseconds or microseconds. A general term that includes both **mutexes** (for exclusive access) and **rw-locks** (for shared access). Certain latches are the focus of [InnoDB](#) performance tuning. Statistics about latch use and contention are available through the **Performance Schema** interface.

See Also [lock](#), [locking](#), [mutex](#), [Performance Schema](#), [rw-lock](#).

### list

The [InnoDB](#) **buffer pool** is represented as a list of memory **pages**. The list is reordered as new pages are accessed and enter the buffer pool, as pages within the buffer pool are accessed again and are considered

---

newer, and as pages that are not accessed for a long time are **evicted** from the buffer pool. The buffer pool is divided into **sublists**, and the replacement policy is a variation of the familiar **LRU** technique. See Also [buffer pool](#), [eviction](#), [LRU](#), [page](#), [sublist](#).

## lock

The high-level notion of an object that controls access to a resource, such as a table, row, or internal data structure, as part of a **locking** strategy. For intensive performance tuning, you might delve into the actual structures that implement locks, such as **mutexes** and **latches**.

See Also [latch](#), [lock mode](#), [locking](#), [mutex](#).

## lock escalation

An operation used in some database systems that converts many **row locks** into a single **table lock**, saving memory space but reducing concurrent access to the table. **InnoDB** uses a space-efficient representation for row locks, so that **lock** escalation is not needed.

See Also [locking](#), [row lock](#), [table lock](#).

## lock mode

A shared (S) **lock** allows a **transaction** to read a row. Multiple transactions can acquire an S lock on that same row at the same time.

An exclusive (X) lock allows a transaction to update or delete a row. No other transaction can acquire any kind of lock on that same row at the same time.

**Intention locks** apply to the table, and are used to indicate what kind of lock the transaction intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an intention exclusive (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an intention shared (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible.

See Also [intention lock](#), [lock](#), [locking](#), [transaction](#).

## locking

The system of protecting a **transaction** from seeing or changing data that is being queried or changed by other transactions. The **locking** strategy must balance reliability and consistency of database operations (the principles of the **ACID** philosophy) against the performance needed for good **concurrency**. Fine-tuning the locking strategy often involves choosing an **isolation level** and ensuring all your database operations are safe and reliable for that isolation level.

See Also [ACID](#), [concurrency](#), [isolation level](#), [locking](#), [transaction](#).

## locking read

A **SELECT** statement that also performs a **locking** operation on an **InnoDB** table. Either **SELECT ... FOR UPDATE** or **SELECT ... LOCK IN SHARE MODE**. It has the potential to produce a **deadlock**, depending on the **isolation level** of the transaction. The opposite of a **non-locking read**. Not allowed for global tables in a **read-only transaction**. See [Section 15.5.2.4, “Locking Reads”](#).

See Also [deadlock](#), [isolation level](#), [locking](#), [non-locking read](#), [read-only transaction](#).

## log

In the **InnoDB** context, “log” or “log files” typically refers to the **redo log** represented by the **ib\_logfileN** files. Another type of **InnoDB** log is the **undo log**, which is a storage area that holds copies of data modified by active transactions.

Other kinds of logs that are important in MySQL are the **error log** (for diagnosing startup and runtime problems), **binary log** (for working with replication and performing point-in-time restores), the **general query log** (for diagnosing application problems), and the **slow query log** (for diagnosing performance problems).

See Also [binary log](#), [error log](#), [general query log](#), [ib\\_logfile](#), [redo log](#), [slow query log](#), [undo log](#).

## log buffer

The memory area that holds data to be written to the **log files** that make up the **redo log**. It is controlled by the **innodb\_log\_buffer\_size** configuration option.

---

See Also [log file](#), [redo log](#).

#### log file

One of the **ib\_logfile**[N](#) files that make up the **redo log**. Data is written to these files from the **log buffer** memory area.

See Also [ib\\_logfile](#), [log buffer](#), [redo log](#).

#### log group

The set of files that make up the **redo log**, typically named [ib\\_logfile0](#) and [ib\\_logfile1](#). (For that reason, sometimes referred to collectively as **ib\_logfile**.)

See Also [ib\\_logfile](#), [redo log](#).

#### logical

A type of operation that involves high-level, abstract aspects such as tables, queries, indexes, and other SQL concepts. Typically, logical aspects are important to make database administration and application development convenient and usable. Contrast with **physical**.

See Also [logical backup](#), [physical](#).

#### logical backup

A **backup** that reproduces table structure and data, without copying the actual data files. For example, the [mysqldump](#) command produces a logical backup, because its output contains statements such as [CREATE TABLE](#) and [INSERT](#) that can re-create the data. Contrast with **physical backup**. A logical backup offers flexibility (for example, you could edit table definitions or insert statements before restoring), but can take substantially longer to **restore** than a physical backup.

See Also [backup](#), [mysqldump](#), [physical backup](#), [restore](#).

#### loose\_

A prefix added to [InnoDB](#) configuration options after server **startup**, so any new configuration options not recognized by the current level of MySQL do not cause a startup failure. MySQL processes configuration options that start with this prefix, but gives a warning rather than a failure if the part after the prefix is not a recognized option.

See Also [startup](#).

#### low-water mark

A value representing a lower limit, typically a threshold value at which some corrective action begins or becomes more aggressive. Contrast with **high-water mark**.

See Also [high-water mark](#).

#### LRU

An acronym for “least recently used”, a common method for managing storage areas. The items that have not been used recently are **evicted** when space is needed to cache newer items. [InnoDB](#) uses the LRU mechanism by default to manage the **pages** within the **buffer pool**, but makes exceptions in cases where a page might be read only a single time, such as during a **full table scan**. This variation of the LRU algorithm is called the **midpoint insertion strategy**. For more information, see [Section 15.6.3.1, “The InnoDB Buffer Pool”](#).

See Also [buffer pool](#), [eviction](#), [full table scan](#), [midpoint insertion strategy](#), [page](#).

#### LSN

Acronym for “log sequence number”. This arbitrary, ever-increasing value represents a point in time corresponding to operations recorded in the **redo log**. (This point in time is regardless of **transaction** boundaries; it can fall in the middle of one or more transactions.) It is used internally by [InnoDB](#) during **crash recovery** and for managing the **buffer pool**.

Prior to MySQL 5.6.3, the LSN was a 4-byte unsigned integer. The LSN became an 8-byte unsigned integer in MySQL 5.6.3 when the redo log file size limit increased from 4GB to 512GB, as additional bytes were required to store extra size information. Applications built on MySQL 5.6.3 or later that use LSN values should use 64-bit rather than 32-bit variables to store and compare LSN values.

In the **MySQL Enterprise Backup** product, you can specify an LSN to represent the point in time from which to take an **incremental backup**. The relevant LSN is displayed by the output of the [mysqlbackup](#) command.

---

Once you have the LSN corresponding to the time of a full backup, you can specify that value to take a subsequent incremental backup, whose output contains another LSN for the next incremental backup. See Also [buffer pool](#), [crash recovery](#), [incremental backup](#), [MySQL Enterprise Backup](#), [redo log](#), [transaction](#).

## M

### .MRG file

A file containing references to other tables, used by the [MERGE](#) storage engine. Files with this extension are always included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product.

See Also [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### .MYD file

A file that MySQL uses to store data for a [MyISAM](#) table.

See Also [.MYI file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### .MYI file

A file that MySQL uses to store indexes for a [MyISAM](#) table.

See Also [.MYD file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### master server

Frequently shortened to “master”. A database server machine in a **replication** scenario that processes the initial insert, update, and delete requests for data. These changes are propagated to, and repeated on, other servers known as **slave servers**.

See Also [replication](#), [slave server](#).

### master thread

An [InnoDB thread](#) that performs various tasks in the background. Most of these tasks are I/O related, such as writing changes from the **change buffer** to the appropriate secondary indexes.

To improve **concurrency**, sometimes actions are moved from the master thread to separate background threads. For example, in MySQL 5.6 and higher, **dirty pages** are **flushed** from the **buffer pool** by the **page cleaner** thread rather than the master thread.

See Also [buffer pool](#), [change buffer](#), [concurrency](#), [dirty page](#), [flush](#), [page cleaner](#), [thread](#).

### MDL

Acronym for “metadata lock”.

See Also [metadata lock](#).

### memcached

A popular component of many MySQL and **NoSQL** software stacks, allowing fast reads and writes for single values and caching the results entirely in memory. Traditionally, applications required extra logic to write the same data to a MySQL database for permanent storage, or to read data from a MySQL database when it was not cached yet in memory. Now, applications can use the simple [memcached](#) protocol, supported by client libraries for many languages, to communicate directly with MySQL servers using **InnoDB** or MySQL Cluster tables. These NoSQL interfaces to MySQL tables allow applications to achieve higher read and write performance than by issuing SQL statements directly, and can simplify application logic and deployment configurations for systems that already incorporate [memcached](#) for in-memory caching.

The [memcached](#) interface to [InnoDB](#) tables is available in MySQL 5.6 and higher; see [Section 15.20, “InnoDB memcached Plugin”](#) for details. The [memcached](#) interface to MySQL Cluster tables is available in MySQL Cluster 7.2; see <http://dev.mysql.com/doc/ndbapi/en/ndbmemcache.html> for details.

See Also [InnoDB](#), [NoSQL](#).

### merge

To apply changes to data cached in memory, such as when a page is brought into the **buffer pool**, and any applicable changes recorded in the **change buffer** are incorporated into the page in the buffer pool. The updated data is eventually written to the **tablespace** by the **flush** mechanism.

See Also [buffer pool](#), [change buffer](#), [flush](#), [tablespace](#).

---

#### metadata lock

A type of **lock** that prevents **DDL** operations on a table that is being used at the same time by another **transaction**. For details, see [Section 9.11.4, “Metadata Locking”](#).

Enhancements to **online** operations, particularly in MySQL 5.6 and higher, are focused on reducing the amount of metadata locking. The objective is for DDL operations that do not change the table structure (such as [CREATE INDEX](#) and [DROP INDEX](#) for [InnoDB](#) tables) to proceed while the table is being queried, updated, and so on by other transactions.

See Also [DDL](#), [lock](#), [online](#), [transaction](#).

#### metrics counter

A feature implemented by the [innodb\\_metrics](#) table in the **INFORMATION\_SCHEMA**, in MySQL 5.6 and higher. You can query **counts** and totals for low-level [InnoDB](#) operations, and use the results for performance tuning in combination with data from the **Performance Schema**.

See Also [counter](#), [INFORMATION\\_SCHEMA](#), [Performance Schema](#).

#### midpoint insertion strategy

The technique of initially bringing **pages** into the [InnoDB buffer pool](#) not at the “newest” end of the list, but instead somewhere in the middle. The exact location of this point can vary, based on the setting of the [innodb\\_old\\_blocks\\_pct](#) option. The intent is that pages that are only read once, such as during a **full table scan**, can be aged out of the buffer pool sooner than with a strict **LRU** algorithm. For more information, see [Section 15.6.3.1, “The InnoDB Buffer Pool”](#).

See Also [buffer pool](#), [full table scan](#), [LRU](#), [page](#).

#### mini-transaction

An internal phase of [InnoDB](#) processing, when making changes at the **physical** level to internal data structures during **DML** operations. A mini-transaction (mtr) has no notion of **rollback**; multiple mini-transactions can occur within a single **transaction**. Mini-transactions write information to the **redo log** that is used during **crash recovery**. A mini-transaction can also happen outside the context of a regular transaction, for example during **purge** processing by background threads.

See Also [commit](#), [crash recovery](#), [DML](#), [physical](#), [purge](#), [redo log](#), [rollback](#), [transaction](#).

#### mixed-mode insert

An [INSERT](#) statement where **auto-increment** values are specified for some but not all of the new rows. For example, a multi-value [INSERT](#) could specify a value for the auto-increment column in some cases and [NULL](#) in other cases. [InnoDB](#) generates auto-increment values for the rows where the column value was specified as [NULL](#). Another example is an [INSERT ... ON DUPLICATE KEY UPDATE](#) statement, where auto-increment values might be generated but not used, for any duplicate rows that are processed as [UPDATE](#) rather than [INSERT](#) statements.

Can cause consistency issues between **master** and **slave** servers in a **replication** configuration. Can require adjusting the value of the [innodb\\_autoinc\\_lock\\_mode](#) configuration option.

See Also [auto-increment](#), [innodb\\_autoinc\\_lock\\_mode](#), [master server](#), [replication](#), [slave server](#).

#### mtr

See [mini-transaction](#).

#### multi-core

A type of processor that can take advantage of multi-threaded programs, such as the MySQL server.

#### multiversion concurrency control

See [MVCC](#).

#### mutex

Informal abbreviation for “mutex variable”. (Mutex itself is short for “mutual exclusion”.) The low-level object that [InnoDB](#) uses to represent and enforce exclusive-access **locks** to internal in-memory data structures. Once the lock is acquired, any other process, thread, and so on is prevented from acquiring the same lock. Contrast with **rw-locks**, which [InnoDB](#) uses to represent and enforce shared-access **locks** to internal in-memory data structures. Mutexes and rw-locks are known collectively as **latches**.

See Also [latch](#), [lock](#), [Performance Schema](#), [Pthreads](#), [rw-lock](#).

---

## MVCC

Acronym for “multiversion concurrency control”. This technique lets [InnoDB transactions](#) with certain **isolation levels** perform **consistent read** operations; that is, to query rows that are being updated by other transactions, and see the values from before those updates occurred. This is a powerful technique to increase **concurrency**, by allowing queries to proceed without waiting due to **locks** held by the other transactions.

This technique is not universal in the database world. Some other database products, and some other MySQL storage engines, do not support it.

See Also [ACID](#), [concurrency](#), [consistent read](#), [isolation level](#), [lock](#), [transaction](#).

## my.cnf

The name, on Unix or Linux systems, of the MySQL **option file**.

See Also [my.ini](#), [option file](#).

## my.ini

The name, on Windows systems, of the MySQL **option file**.

See Also [my.cnf](#), [option file](#).

## mysql

The [mysql](#) program is the command-line interpreter for the MySQL database. It processes **SQL** statements, and also MySQL-specific commands such as [SHOW TABLES](#), by passing requests to the [mysqld](#) daemon.

See Also [mysqld](#), [SQL](#).

## MySQL Enterprise Backup

A licensed product that performs **hot backups** of MySQL databases. It offers the most efficiency and flexibility when backing up [InnoDB](#) tables, but can also back up [MyISAM](#) and other kinds of tables.

See Also [hot backup](#), [InnoDB](#).

## mysqlbackup command

A command-line tool of the **MySQL Enterprise Backup** product. It performs a **hot backup** operation for [InnoDB](#) tables, and a [warm backup](#) for [MyISAM](#) and other kinds of tables. See [Section 28.2, “MySQL Enterprise Backup Overview”](#) for more information about this command.

See Also [hot backup](#), [MySQL Enterprise Backup](#), [warm backup](#).

## mysqld

The [mysqld](#) program is the database engine for the MySQL database. It runs as a Unix daemon or Windows service, constantly waiting for requests and performing maintenance work in the background.

See Also [mysql](#).

## mysqldump

A command that performs a **logical backup** of some combination of databases, tables, and table data. The results are SQL statements that reproduce the original schema objects, data, or both. For substantial amounts of data, a **physical backup** solution such as **MySQL Enterprise Backup** is faster, particularly for the **restore** operation.

See Also [logical backup](#), [MySQL Enterprise Backup](#), [physical backup](#), [restore](#).

# N

## natural key

An indexed column, typically a **primary key**, where the values have some real-world significance. Usually advised against because:

- If the value should ever change, there is potentially a lot of index maintenance to re-sort the **clustered index** and update the copies of the primary key value that are repeated in each **secondary index**.
- Even seemingly stable values can change in unpredictable ways that are difficult to represent correctly in the database. For example, one country can change into two or several, making the original country code obsolete. Or, rules about unique values might have exceptions. For example, even if taxpayer IDs are intended to be unique to a single person, a database might have to handle records that violate that rule, such as in cases of identity theft. Taxpayer IDs and other sensitive ID numbers also make poor

---

primary keys, because they may need to be secured, encrypted, and otherwise treated differently than other columns.

Thus, it is typically better to use arbitrary numeric values to form a **synthetic key**, for example using an **auto-increment** column.

See Also [auto-increment](#), [clustered index](#), [primary key](#), [secondary index](#), [synthetic key](#).

#### neighbor page

Any **page** in the same **extent** as a particular page. When a page is selected to be **flushed**, any neighbor pages that are **dirty** are typically flushed as well, as an I/O optimization for traditional hard disks. In MySQL 5.6 and up, this behavior can be controlled by the configuration variable `innodb_flush_neighbors`; you might turn that setting off for SSD drives, which do not have the same overhead for writing smaller batches of data at random locations.

See Also [dirty page](#), [extent](#), [flush](#), [page](#).

#### next-key lock

A combination of a **record lock** on the index record and a [gap lock](#) on the gap before the index record.

See Also [gap lock](#), [locking](#), [record lock](#).

#### non-blocking I/O

An industry term that means the same as **asynchronous I/O**.

See Also [asynchronous I/O](#).

#### non-locking read

A **query** that does not use the `SELECT ... FOR UPDATE` or `SELECT ... LOCK IN SHARE MODE` clauses. The only kind of query allowed for global tables in a **read-only transaction**. The opposite of a **locking read**.

See Also [locking read](#), [query](#), [read-only transaction](#).

#### non-repeatable read

The situation when a query retrieves data, and a later query within the same **transaction** retrieves what should be the same data, but the queries return different results (changed by another transaction committing in the meantime).

This kind of operation goes against the **ACID** principle of database design. Within a transaction, data should be consistent, with predictable and stable relationships.

Among different **isolation levels**, non-repeatable reads are prevented by the **serializable read** and **repeatable read** levels, and allowed by the **consistent read**, and **read uncommitted** levels.

See Also [ACID](#), [consistent read](#), [isolation level](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

#### normalized

A database design strategy where data is split into multiple tables, and duplicate values condensed into single rows represented by an ID, to avoid storing, querying, and updating redundant or lengthy values. It is typically used in **OLTP** applications.

For example, an address might be given a unique ID, so that a census database could represent the relationship **lives at this address** by associating that ID with each member of a family, rather than storing multiple copies of a complex value such as **123 Main Street, Anytown, USA**.

For another example, although a simple address book application might store each phone number in the same table as a person's name and address, a phone company database might give each phone number a special ID, and store the numbers and IDs in a separate table. This normalized representation could simplify large-scale updates when area codes split apart.

Normalization is not always recommended. Data that is primarily queried, and only updated by deleting entirely and reloading, is often kept in fewer, larger tables with redundant copies of duplicate values. This data representation is referred to as **denormalized**, and is frequently found in data warehousing applications.

See Also [denormalized](#), [foreign key](#), [OLTP](#), [relational](#).

---

## NoSQL

A broad term for a set of data access technologies that do not use the **SQL** language as their primary mechanism for reading and writing data. Some NoSQL technologies act as key-value stores, only accepting single-value reads and writes; some relax the restrictions of the **ACID** methodology; still others do not require a pre-planned **schema**. MySQL users can combine NoSQL-style processing for speed and simplicity with SQL operations for flexibility and convenience, by using the **memcached** API to directly access some kinds of MySQL tables. The **memcached** interface to **InnoDB** tables is available in MySQL 5.6 and higher; see [Section 15.20, “InnoDB memcached Plugin”](#) for details. The **memcached** interface to MySQL Cluster tables is available in MySQL Cluster 7.2; see [ndbmemcache—Memcache API for NDB Cluster](#). See Also [ACID](#), [InnoDB](#), [memcached](#), [schema](#), [SQL](#).

## NOT NULL constraint

A type of **constraint** that specifies that a **column** cannot contain any **NULL** values. It helps to preserve **referential integrity**, as the database server can identify data with erroneous missing values. It also helps in the arithmetic involved in query optimization, allowing the optimizer to predict the number of entries in an index on that column.

See Also [column](#), [constraint](#), [NULL](#), [primary key](#), [referential integrity](#).

## NULL

A special value in **SQL**, indicating the absence of data. Any arithmetic operation or equality test involving a **NULL** value, in turn produces a **NULL** result. (Thus it is similar to the IEEE floating-point concept of NaN, “not a number”.) Any aggregate calculation such as **AVG( )** ignores rows with **NULL** values, when determining how many rows to divide by. The only test that works with **NULL** values uses the SQL idioms **IS NULL** or **IS NOT NULL**.

**NULL** values play a part in **index** operations, because for performance a database must minimize the overhead of keeping track of missing data values. Typically, **NULL** values are not stored in an index, because a query that tests an indexed column using a standard comparison operator could never match a row with a **NULL** value for that column. For the same reason, unique indexes do not prevent **NULL** values; those values simply are not represented in the index. Declaring a **NOT NULL** constraint on a column provides reassurance that there are no rows left out of the index, allowing for better query optimization (accurate counting of rows and estimation of whether to use the index).

Because the **primary key** must be able to uniquely identify every row in the table, a single-column primary key cannot contain any **NULL** values, and a multi-column primary key cannot contain any rows with **NULL** values in all columns.

Although the Oracle database allows a **NULL** value to be concatenated with a string, **InnoDB** treats the result of such an operation as **NULL**.

See Also [index](#), [primary key](#), [SQL](#).

## O

### .OPT file

A file containing database configuration information. Files with this extension are included in backups produced by the **mysqlbackup** command of the **MySQL Enterprise Backup** product.

See Also [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### off-page column

A column containing variable-length data (such as **BLOB** and **VARCHAR**) that is too long to fit on a **B-tree** page. The data is stored in **overflow pages**. The **DYNAMIC** row format is more efficient for such storage than the older **COMPACT** row format.

See Also [B-tree](#), [compact row format](#), [dynamic row format](#), [overflow page](#).

## OLTP

Acronym for “Online Transaction Processing”. A database system, or a database application, that runs a workload with many **transactions**, with frequent writes as well as reads, typically affecting small amounts of data at a time. For example, an airline reservation system or an application that processes bank deposits. The data might be organized in **normalized** form for a balance between **DML** (insert/update/delete) efficiency and **query** efficiency. Contrast with **data warehouse**.

---

With its **row-level locking** and **transactional** capability, **InnoDB** is the ideal storage engine for MySQL tables used in OLTP applications.

See Also [data warehouse](#), [DML](#), [InnoDB](#), [query](#), [row lock](#), [transaction](#).

#### online

A type of operation that involves no downtime, blocking, or restricted operation for the database. Typically applied to **DDL**. Operations that shorten the periods of restricted operation, such as **fast index creation**, have evolved into a wider set of **online DDL** operations in MySQL 5.6.

In the context of backups, a **hot backup** is an online operation and a **warm backup** is partially an online operation.

See Also [DDL](#), [Fast Index Creation](#), [hot backup](#), [online DDL](#), [warm backup](#).

#### online DDL

A feature that improves the performance, concurrency, and availability of **InnoDB** tables during **DDL** (primarily [ALTER TABLE](#)) operations. See [Section 15.13, “InnoDB and Online DDL”](#) for details.

The details vary according to the type of operation. In some cases, the table can be modified concurrently while the [ALTER TABLE](#) is in progress. The operation might be able to be performed without a table copy, or using a specially optimized type of table copy. Space usage is controlled by the [innodb\\_online\\_alter\\_log\\_max\\_size](#) configuration option.

This feature is an enhancement of the **Fast Index Creation** feature in MySQL 5.5.

See Also [DDL](#), [Fast Index Creation](#), [online](#).

#### optimistic

A methodology that guides low-level implementation decisions for a relational database system. The requirements of performance and **concurrency** in a relational database mean that operations must be started or dispatched quickly. The requirements of consistency and **referential integrity** mean that any operation could fail: a transaction might be rolled back, a **DML** operation could violate a constraint, a request for a lock could cause a deadlock, a network error could cause a timeout. An optimistic strategy is one that assumes most requests or attempts will succeed, so that relatively little work is done to prepare for the failure case. When this assumption is true, the database does little unnecessary work; when requests do fail, extra work must be done to clean up and undo changes.

**InnoDB** uses optimistic strategies for operations such as **locking** and **commits**. For example, data changed by a transaction can be written to the data files before the commit occurs, making the commit itself very fast, but requiring more work to undo the changes if the transaction is rolled back.

The opposite of an optimistic strategy is a **pessimistic** one, where a system is optimized to deal with operations that are unreliable and frequently unsuccessful. This methodology is rare in a database system, because so much care goes into choosing reliable hardware, networks, and algorithms.

See Also [commit](#), [concurrency](#), [DML](#), [locking](#), [pessimistic](#), [referential integrity](#).

#### optimizer

The MySQL component that determines the best **indexes** and **join** order to use for a **query**, based on characteristics and data distribution of the relevant **tables**.

See Also [index](#), [join](#), [query](#), [table](#).

#### option

A configuration parameter for MySQL, either stored in the **option file** or passed on the command line.

For the **options** that apply to **InnoDB** tables, each option name starts with the prefix [innodb\\_](#).

See Also [InnoDB](#), [option](#), [option file](#).

#### option file

The file that holds the configuration **options** for the MySQL instance. Traditionally, on Linux and Unix this file is named [my.cnf](#), and on Windows it is named [my.ini](#).

See Also [configuration file](#), [my.cnf](#), [my.ini](#), [option](#).

---

overflow page

Separately allocated disk **pages** that hold variable-length columns (such as [BLOB](#) and [VARCHAR](#)) that are too long to fit on a **B-tree** page. The associated columns are known as **off-page columns**.

See Also [B-tree](#), [off-page column](#), [page](#).

## P

.PAR file

A file containing partition definitions. Files with this extension are always included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product.

With the introduction of native partitioning support for [InnoDB](#) tables in MySQL 5.7.6, [.PAR](#) files are no longer created for partitioned [InnoDB](#) tables.

See Also [MySQL Enterprise Backup](#), [mysqlbackup command](#).

page

A unit representing how much data [InnoDB](#) transfers at any one time between disk (the **data files**) and memory (the **buffer pool**). A page can contain one or more **rows**, depending on how much data is in each row. If a row does not fit entirely into a single page, [InnoDB](#) sets up additional pointer-style data structures so that the information about the row can be stored in one page.

One way to fit more data in each page is to use **compressed row format**. For tables that use BLOBs or large text fields, **compact row format** allows those large columns to be stored separately from the rest of the row, reducing I/O overhead and memory usage for queries that do not reference those columns.

When [InnoDB](#) reads or writes sets of pages as a batch to increase I/O throughput, it reads or writes an **extent** at a time.

All the [InnoDB](#) disk data structures within a MySQL instance share the same **page size**.

See Also [buffer pool](#), [compact row format](#), [compressed row format](#), [data files](#), [extent](#), [page size](#), [row](#).

page cleaner

An [InnoDB](#) background **thread** that **flushes dirty pages** from the **buffer pool**. Prior to MySQL 5.6, this activity was performed by the **master thread**. The number of page cleaner threads is controlled by the [innodb\\_page\\_cleaners](#) configuration option, introduced in MySQL 5.7.4.

See Also [buffer pool](#), [dirty page](#), [flush](#), [master thread](#), [thread](#).

page size

For releases up to and including MySQL 5.5, the size of each [InnoDB](#) **page** is fixed at 16 kilobytes. This value represents a balance: large enough to hold the data for most rows, yet small enough to minimize the performance overhead of transferring unneeded data to memory. Other values are not tested or supported.

Starting in MySQL 5.6, the page size for an [InnoDB](#) **instance** can be either 4KB, 8KB, or 16KB, controlled by the [innodb\\_page\\_size](#) configuration option. As of MySQL 5.7.6, [InnoDB](#) also supports 32KB and 64KB page sizes. For 32KB and 64KB page sizes, [ROW\\_FORMAT=COMPRESSED](#) is not supported and the maximum record size is 16KB.

Page size is set when creating the MySQL instance, and it remains constant afterward. The same page size applies to all [InnoDB tablespaces](#), including the **system tablespace**, **file-per-table** tablespaces, and **general tablespaces**.

Smaller page sizes can help performance with storage devices that use small block sizes, particularly for **SSD** devices in **disk-bound** workloads, such as for **OLTP** applications. As individual rows are updated, less data is copied into memory, written to disk, reorganized, locked, and so on.

See Also [disk-bound](#), [file-per-table](#), [general tablespace](#), [instance](#), [OLTP](#), [page](#), [SSD](#), [system tablespace](#), [tablespace](#).

parent table

The table in a **foreign key** relationship that holds the initial column values pointed to from the **child table**.

The consequences of deleting, or updating rows in the parent table depend on the [ON UPDATE](#) and [ON DELETE](#) clauses in the foreign key definition. Rows with corresponding values in the child table could be

---

automatically deleted or updated in turn, or those columns could be set to [NULL](#), or the operation could be prevented.

See Also [child table](#), [foreign key](#).

#### partial backup

A **backup** that contains some of the **tables** in a MySQL database, or some of the databases in a MySQL instance. Contrast with **full backup**.

See Also [backup](#), [full backup](#), [table](#).

#### partial index

An **index** that represents only part of a column value, typically the first N characters (the **prefix**) of a long [VARCHAR](#) value.

See Also [index](#), [index prefix](#).

#### Performance Schema

The [performance\\_schema](#) schema, in MySQL 5.5 and up, presents a set of tables that you can query to get detailed information about the performance characteristics of many internal parts of the MySQL server.

See [Chapter 24, MySQL Performance Schema](#).

See Also [INFORMATION\\_SCHEMA](#), [latch](#), [mutex](#), [rw-lock](#).

#### persistent statistics

A feature in MySQL 5.6 that stores **index** statistics for [InnoDB tables](#) on disk, providing better **plan stability** for **queries**. For more information, see [Section 15.6.11.1, “Configuring Persistent Optimizer Statistics Parameters”](#).

See Also [index](#), [optimizer](#), [plan stability](#), [query](#), [table](#).

#### pessimistic

A methodology that sacrifices performance or concurrency in favor of safety. It is appropriate if a high proportion of requests or attempts might fail, or if the consequences of a failed request are severe. [InnoDB](#) uses what is known as a pessimistic **locking** strategy, to minimize the chance of **deadlocks**. At the application level, you might avoid deadlocks by using a pessimistic strategy of acquiring all locks needed by a transaction at the very beginning.

Many built-in database mechanisms use the opposite **optimistic** methodology.

See Also [deadlock](#), [locking](#), [optimistic](#).

#### phantom

A row that appears in the result set of a query, but not in the result set of an earlier query. For example, if a query is run twice within a **transaction**, and in the meantime, another transaction commits after inserting a new row or updating a row so that it matches the [WHERE](#) clause of the query.

This occurrence is known as a phantom read. It is harder to guard against than a **non-repeatable read**, because locking all the rows from the first query result set does not prevent the changes that cause the phantom to appear.

Among different **isolation levels**, phantom reads are prevented by the **serializable read** level, and allowed by the **repeatable read**, **consistent read**, and **read uncommitted** levels.

See Also [consistent read](#), [isolation level](#), [non-repeatable read](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

#### physical

A type of operation that involves hardware-related aspects such as disk blocks, memory pages, files, bits, disk reads, and so on. Typically, physical aspects are important during expert-level performance tuning and problem diagnosis. Contrast with **logical**.

See Also [logical](#), [physical backup](#).

#### physical backup

A **backup** that copies the actual data files. For example, the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product produces a physical backup, because its output contains data files that can be used directly by the [mysqld](#) server, resulting in a faster **restore** operation. Contrast with **logical backup**.

See Also [backup](#), [logical backup](#), [MySQL Enterprise Backup](#), [restore](#).

---

## PITR

Acronym for **point-in-time recovery**.

See Also [point-in-time recovery](#).

## plan stability

A property of a **query execution plan**, where the optimizer makes the same choices each time for a given **query**, so that performance is consistent and predictable.

See Also [query](#), [query execution plan](#).

## point-in-time recovery

The process of restoring a **backup** to recreate the state of the database at a specific date and time.

Commonly abbreviated “PITR”. Because it is unlikely that the specified time corresponds exactly to the time of a backup, this technique usually requires a combination of a **physical backup** and a **logical backup**. For example, with the **MySQL Enterprise Backup** product, you restore the last backup that you took before the specified point in time, then replay changes from the **binary log** between the time of the backup and the PITR time.

See Also [backup](#), [binary log](#), [logical backup](#), [MySQL Enterprise Backup](#), [physical backup](#).

## prefix

See [index prefix](#).

## prepared backup

A set of backup files, produced by the **MySQL Enterprise Backup** product, after all the stages of applying **binary logs** and **incremental backups** are finished. The resulting files are ready to be **restored**. Prior to the apply steps, the files are known as a **raw backup**.

See Also [binary log](#), [hot backup](#), [incremental backup](#), [MySQL Enterprise Backup](#), [raw backup](#), [restore](#).

## primary key

A set of columns—and by implication, the index based on this set of columns—that can uniquely identify every row in a table. As such, it must be a unique index that does not contain any [NULL](#) values.

[InnoDB](#) requires that every table has such an index (also called the **clustered index** or **cluster index**), and organizes the table storage based on the column values of the primary key.

When choosing primary key values, consider using arbitrary values (a **synthetic key**) rather than relying on values derived from some other source (a **natural key**).

See Also [clustered index](#), [index](#), [natural key](#), [synthetic key](#).

## process

An instance of an executing program. The operating system switches between multiple running processes, allowing for a certain degree of **concurrency**. On most operating systems, processes can contain multiple **threads** of execution that share resources. Context-switching between threads is faster than the equivalent switching between processes.

See Also [concurrency](#), [thread](#).

## pseudo-record

An artificial record in an index, used for **locking** key values or ranges that do not currently exist.

See Also [infimum record](#), [locking](#), [supremum record](#).

## Pthreads

The POSIX threads standard, which defines an API for threading and locking operations on Unix and Linux systems. On Unix and Linux systems, [InnoDB](#) uses this implementation for **mutexes**.

See Also [mutex](#).

## purge

A type of garbage collection performed by one or more separate background threads (controlled by [innodb\\_purge\\_threads](#)) that runs on a periodic schedule. Purge parses and processes **undo log** pages from the **history list** for the purpose of removing clustered and secondary index records that were marked for deletion (by previous [DELETE](#) statements) and are no longer required for **MVCC** or **rollback**. Purge frees undo log pages from the history list after processing them.

See Also [history list](#), [MVCC](#), [rollback](#), [undo log](#).

---

### purge buffering

The technique of storing changes to secondary index pages, resulting from [DELETE](#) operations, in the **change buffer** rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally purges an index record that was previously marked for deletion.) It is one of the types of **change buffering**; the others are **insert buffering** and **delete buffering**.

See Also [change buffer](#), [change buffering](#), [delete buffering](#), [insert buffer](#), [insert buffering](#).

### purge lag

Another name for the [InnoDB history list](#). Related to the [innodb\\_max\\_purge\\_lag](#) configuration option.

See Also [history list](#), [purge](#).

### purge thread

A **thread** within the [InnoDB](#) process that is dedicated to performing the periodic **purge** operation. In MySQL 5.6 and higher, multiple purge threads are enabled by the [innodb\\_purge\\_threads](#) configuration option.

See Also [purge](#), [thread](#).

## Q

### query

In **SQL**, an operation that reads information from one or more **tables**. Depending on the organization of data and the parameters of the query, the lookup might be optimized by consulting an **index**. If multiple tables are involved, the query is known as a **join**.

For historical reasons, sometimes discussions of internal processing for statements use “query” in a broader sense, including other types of MySQL statements such as **DDL** and **DML** statements.

See Also [DDL](#), [DML](#), [index](#), [join](#), [SQL](#), [table](#).

### query execution plan

The set of decisions made by the optimizer about how to perform a **query** most efficiently, including which **index** or indexes to use, and the order in which to **join** tables. **Plan stability** involves the same choices being made consistently for a given query.

See Also [index](#), [join](#), [plan stability](#), [query](#).

### query log

See [general query log](#).

### quiesce

To reduce the amount of database activity, often in preparation for an operation such as an [ALTER TABLE](#), a **backup**, or a **shutdown**. Might or might not involve doing as much **flushing** as possible, so that **InnoDB** does not continue doing background I/O.

In MySQL 5.6 and higher, the syntax [FLUSH TABLES ... FOR EXPORT](#) writes some data to disk for [InnoDB](#) tables that make it simpler to back up those tables by copying the data files.

See Also [backup](#), [flush](#), [InnoDB](#), [shutdown](#).

## R

### R-tree

A tree data structure used for spatial indexing of multi-dimensional data such as geographical coordinates, rectangles or polygons.

See Also [B-tree](#).

### RAID

Acronym for “Redundant Array of Inexpensive Drives”. Spreading I/O operations across multiple drives enables greater **concurrency** at the hardware level, and improves the efficiency of low-level write operations that otherwise would be performed in sequence.

See Also [concurrency](#).

---

#### random dive

A technique for quickly estimating the number of different values in a column (the column's **cardinality**). [InnoDB](#) samples pages at random from the index and uses that data to estimate the number of different values.

See Also [cardinality](#).

#### raw backup

The initial set of backup files produced by the **MySQL Enterprise Backup** product, before the changes reflected in the **binary log** and any **incremental backups** are applied. At this stage, the files are not ready to **restore**. After these changes are applied, the files are known as a **prepared backup**.

See Also [binary log](#), [hot backup](#), [ibbackup\\_logfile](#), [incremental backup](#), [MySQL Enterprise Backup](#), [prepared backup](#), [restore](#).

#### READ COMMITTED

An **isolation level** that uses a **locking** strategy that relaxes some of the protection between **transactions**, in the interest of performance. Transactions cannot see uncommitted data from other transactions, but they can see data that is committed by another transaction after the current transaction started. Thus, a transaction never sees any bad data, but the data that it does see may depend to some extent on the timing of other transactions.

When a transaction with this isolation level performs `UPDATE ... WHERE` or `DELETE ... WHERE` operations, other transactions might have to wait. The transaction can perform `SELECT ... FOR UPDATE`, and `LOCK IN SHARE MODE` operations without making other transactions wait.

See Also [ACID](#), [isolation level](#), [locking](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

#### read phenomena

Phenomena such as **dirty reads**, **non-repeatable reads**, and **phantom** reads which can occur when a transaction reads data that another transaction has modified.

See Also [dirty read](#), [non-repeatable read](#), [phantom](#).

#### READ UNCOMMITTED

The **isolation level** that provides the least amount of protection between transactions. Queries employ a **locking** strategy that allows them to proceed in situations where they would normally wait for another transaction. However, this extra performance comes at the cost of less reliable results, including data that has been changed by other transactions and not committed yet (known as **dirty read**). Use this isolation level with great caution, and be aware that the results might not be consistent or reproducible, depending on what other transactions are doing at the same time. Typically, transactions with this isolation level only do queries, not insert, update, or delete operations.

See Also [ACID](#), [dirty read](#), [isolation level](#), [locking](#), [transaction](#).

#### read view

An internal snapshot used by the **MVCC** mechanism of [InnoDB](#). Certain **transactions**, depending on their **isolation level**, see the data values as they were at the time the transaction (or in some cases, the statement) started. Isolation levels that use a read view are **REPEATABLE READ**, **READ COMMITTED**, and **READ UNCOMMITTED**.

See Also [isolation level](#), [MVCC](#), [READ COMMITTED](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [transaction](#).

#### read-ahead

A type of I/O request that prefetches a group of **pages** (an entire **extent**) into the **buffer pool** asynchronously, in anticipation that these pages will be needed soon. The linear read-ahead technique prefetches all the pages of one extent based on access patterns for pages in the preceding extent. The random read-ahead technique prefetches all the pages for an extent once a certain number of pages from the same extent are in the buffer pool. Random read-ahead is not part of MySQL 5.5, but is re-introduced in MySQL 5.6 under the control of the `innodb_random_read_ahead` configuration option.

See Also [buffer pool](#), [extent](#), [page](#).

#### read-only transaction

A type of **transaction** that can be optimized for [InnoDB](#) tables by eliminating some of the bookkeeping involved with creating a **read view** for each transaction. Can only perform **non-locking read** queries. It can

---

be started explicitly with the syntax `START TRANSACTION READ ONLY`, or automatically under certain conditions. See [Section 9.5.3, “Optimizing InnoDB Read-Only Transactions”](#) for details.  
See Also [non-locking read](#), [read view](#), [transaction](#).

#### record lock

A [lock](#) on an index record. For example, `SELECT c1 FROM t WHERE c1 = 10 FOR UPDATE;` prevents any other transaction from inserting, updating, or deleting rows where the value of `t.c1` is 10. Contrast with [gap lock](#) and [next-key lock](#).  
See Also [gap lock](#), [lock](#), [next-key lock](#).

#### redo

The data, in units of records, recorded in the **redo log** when [DML](#) statements make changes to [InnoDB](#) tables. It is used during **crash recovery** to correct data written by incomplete **transactions**. The ever-increasing **LSN** value represents the cumulative amount of redo data that has passed through the redo log.  
See Also [crash recovery](#), [DML](#), [LSN](#), [redo log](#), [transaction](#).

#### redo log

A disk-based data structure used during **crash recovery**, to correct data written by incomplete **transactions**. During normal operation, it encodes requests to change [InnoDB](#) table data, which result from SQL statements or low-level API calls through NoSQL interfaces. Modifications that did not finish updating the **data files** before an unexpected **shutdown** are replayed automatically.

The redo log is physically represented as a set of files, typically named `ib_logfile0` and `ib_logfile1`. The data in the redo log is encoded in terms of records affected; this data is collectively referred to as **redo**. The passage of data through the redo logs is represented by the ever-increasing **LSN** value. The original 4GB limit on maximum size for the redo log is raised to 512GB in MySQL 5.6.3.

The disk layout of the redo log is influenced by the configuration options `innodb_log_file_size`, `innodb_log_group_home_dir`, and (rarely) `innodb_log_files_in_group`. The performance of redo log operations is also affected by the **log buffer**, which is controlled by the `innodb_log_buffer_size` configuration option.

See Also [crash recovery](#), [data files](#), [ib\\_logfile](#), [log buffer](#), [LSN](#), [redo](#), [shutdown](#), [transaction](#).

#### redundant row format

The oldest [InnoDB row format](#). Prior to MySQL 5.0.3, it was the only row format available in [InnoDB](#). From MySQL 5.0.3 to MySQL 5.7.8, the default row format is **COMPACT**. As of MySQL 5.7.9, the default row format is defined by the `innodb_default_row_format` configuration option, which has a default setting of **DYNAMIC**. You can still specify the **REDUNDANT** row format for compatibility with older [InnoDB](#) tables.

For more information, see [Section 15.11.4, “COMPACT and REDUNDANT Row Formats”](#).  
See Also [compact row format](#), [dynamic row format](#), [row format](#).

#### referential integrity

The technique of maintaining data always in a consistent format, part of the **ACID** philosophy. In particular, data in different tables is kept consistent through the use of **foreign key constraints**, which can prevent changes from happening or automatically propagate those changes to all related tables. Related mechanisms include the **unique constraint**, which prevents duplicate values from being inserted by mistake, and the **NOT NULL constraint**, which prevents blank values from being inserted by mistake.

See Also [ACID](#), [FOREIGN KEY constraint](#), [NOT NULL constraint](#), [unique constraint](#).

#### relational

An important aspect of modern database systems. The database server encodes and enforces relationships such as one-to-one, one-to-many, many-to-one, and uniqueness. For example, a person might have zero, one, or many phone numbers in an address database; a single phone number might be associated with several family members. In a financial database, a person might be required to have exactly one taxpayer ID, and any taxpayer ID could only be associated with one person.

The database server can use these relationships to prevent bad data from being inserted, and to find efficient ways to look up information. For example, if a value is declared to be unique, the server can stop searching as soon as the first match is found, and it can reject attempts to insert a second copy of the same value.

---

At the database level, these relationships are expressed through SQL features such as **columns** within a table, unique and **NOT NULL constraints**, **foreign keys**, and different kinds of join operations. Complex relationships typically involve data split between more than one table. Often, the data is **normalized**, so that duplicate values in one-to-many relationships are stored only once.

In a mathematical context, the relations within a database are derived from set theory. For example, the **OR** and **AND** operators of a **WHERE** clause represent the notions of union and intersection.

See Also [ACID](#), [column](#), [constraint](#), [foreign key](#), [normalized](#).

#### relevance

In the **full-text search** feature, a number signifying the similarity between the search string and the data in the **FULLTEXT index**. For example, when you search for a single word, that word is typically more relevant for a row where it occurs several times in the text than a row where it appears only once.

See Also [full-text search](#), [FULLTEXT index](#).

#### REPEATABLE READ

The default **isolation level** for [InnoDB](#). It prevents any rows that are queried from being changed by other **transactions**, thus blocking **non-repeatable reads** but not **phantom** reads. It uses a moderately strict **locking** strategy so that all queries within a transaction see data from the same snapshot, that is, the data as it was at the time the transaction started.

When a transaction with this isolation level performs **UPDATE ... WHERE**, **DELETE ... WHERE**, **SELECT ... FOR UPDATE**, and **LOCK IN SHARE MODE** operations, other transactions might have to wait.

See Also [ACID](#), [consistent read](#), [isolation level](#), [locking](#), [phantom](#), [transaction](#).

#### replication

The practice of sending changes from a **master database**, to one or more **slave databases**, so that all databases have the same data. This technique has a wide range of uses, such as load-balancing for better scalability, disaster recovery, and testing software upgrades and configuration changes. The changes can be sent between the database by methods called **row-based replication** and **statement-based replication**.

See Also [master server](#), [row-based replication](#), [slave server](#), [statement-based replication](#).

#### restore

The process of putting a set of backup files from the **MySQL Enterprise Backup** product in place for use by MySQL. This operation can be performed to fix a corrupted database, to return to some earlier point in time, or (in a **replication** context) to set up a new **slave database**. In the **MySQL Enterprise Backup** product, this operation is performed by the **copy-back** option of the [mysqlbackup](#) command.

See Also [hot backup](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#), [prepared backup](#), [replication](#), [slave server](#).

#### rollback

A **SQL** statement that ends a **transaction**, undoing any changes made by the transaction. It is the opposite of **commit**, which makes permanent any changes made in the transaction.

By default, MySQL uses the **autocommit** setting, which automatically issues a commit following each SQL statement. You must change this setting before you can use the rollback technique.

See Also [ACID](#), [autocommit](#), [commit](#), [SQL](#), [transaction](#).

#### rollback segment

The storage area containing the **undo log**. By default, this area is physically part of the **system tablespace**. However, as of MySQL 5.6.3, undo logs can reside in separate **undo tablespaces**.

See Also [system tablespace](#), [undo log](#), [undo tablespace](#).

#### row

The logical data structure defined by a set of **columns**. A set of rows makes up a **table**. Within [InnoDB data files](#), each **page** can contain one or more rows.

Although [InnoDB](#) uses the term **row format** for consistency with MySQL syntax, the row format is a property of each table and applies to all rows in that table.

---

See Also [column](#), [data files](#), [page](#), [row format](#), [table](#).

#### row format

The disk storage format for **rows** of an **InnoDB table**. As **InnoDB** gains new capabilities such as **compression**, new row formats are introduced to support the resulting improvements in storage efficiency and performance.

The row format of an **InnoDB** table is specified by the [ROW\\_FORMAT](#) option or by the [innodb\\_default\\_row\\_format](#) configuration option (introduced in MySQL 5.7.9). Row formats include [REDUNDANT](#), [COMPACT](#), [COMPRESSED](#), and [DYNAMIC](#). To view the row format of an **InnoDB** table, issue the [SHOW TABLE STATUS](#) statement or query [INFORMATION\\_SCHEMA.INNODB\\_SYS\\_TABLES](#) (available in MySQL 5.6 or higher).

See Also [compact row format](#), [compressed row format](#), [compression](#), [dynamic row format](#), [redundant row format](#), [row](#), [table](#).

#### row lock

A **lock** that prevents a row from being accessed in an incompatible way by another **transaction**. Other rows in the same table can be freely written to by other transactions. This is the type of **locking** done by **DML** operations on **InnoDB** tables.

Contrast with **table locks** used by **MyISAM**, or during **DDL** operations on **InnoDB** tables that cannot be done with **online DDL**; those locks block concurrent access to the table.

See Also [DDL](#), [DML](#), [InnoDB](#), [lock](#), [locking](#), [online DDL](#), [table lock](#), [transaction](#).

#### row-based replication

A form of **replication** where events are propagated from the **master server** specifying how to change individual rows on the **slave server**. It is safe to use for all settings of the [innodb\\_autoinc\\_lock\\_mode](#) option.

See Also [auto-increment locking](#), [innodb\\_autoinc\\_lock\\_mode](#), [master server](#), [replication](#), [slave server](#), [statement-based replication](#).

#### row-level locking

The **locking** mechanism used for **InnoDB** tables, relying on **row locks** rather than **table locks**. Multiple **transactions** can modify the same table concurrently. Only if two transactions try to modify the same row does one of the transactions wait for the other to complete (and release its row locks).

See Also [InnoDB](#), [locking](#), [row lock](#), [table lock](#), [transaction](#).

#### rw-lock

The low-level object that **InnoDB** uses to represent and enforce shared-access **locks** to internal in-memory data structures following certain rules. Contrast with **mutexes**, which **InnoDB** uses to represent and enforce exclusive access to internal in-memory data structures. Mutexes and rw-locks are known collectively as **latches**.

[rw-lock](#) types include [s-locks](#) (shared locks), [x-locks](#) (exclusive locks), and [sx-locks](#) (shared-exclusive locks).

- An [s-lock](#) provides read access to a common resource.
- An [x-lock](#) provides write access to a common resource while not permitting inconsistent reads by other threads.
- An [sx-lock](#) provides write access to a common resource while permitting inconsistent reads by other threads. [sx-locks](#) were introduced in MySQL 5.7 to optimize concurrency and improve scalability for read-write workloads.

The following matrix summarizes rw-lock type compatibility.

|                   | <a href="#">S</a> | <a href="#">SX</a> | <a href="#">X</a> |
|-------------------|-------------------|--------------------|-------------------|
| <a href="#">S</a> | Compatible        | Compatible         | Conflict          |

|           | <i>S</i>   | <i>SX</i> | <i>X</i> |
|-----------|------------|-----------|----------|
| <i>SX</i> | Compatible | Conflict  | Conflict |
| <i>X</i>  | Conflict   | Conflict  | Conflict |

See Also [latch](#), [lock](#), [mutex](#), [Performance Schema](#).

## S

### savepoint

Savepoints help to implement nested **transactions**. They can be used to provide scope to operations on tables that are part of a larger transaction. For example, scheduling a trip in a reservation system might involve booking several different flights; if a desired flight is unavailable, you might **roll back** the changes involved in booking that one leg, without rolling back the earlier flights that were successfully booked.

See Also [rollback](#), [transaction](#).

### scalability

The ability to add more work and issue more simultaneous requests to a system, without a sudden drop in performance due to exceeding the limits of system capacity. Software architecture, hardware configuration, application coding, and type of workload all play a part in scalability. When the system reaches its maximum capacity, popular techniques for increasing scalability are **scale up** (increasing the capacity of existing hardware or software) and **scale out** (adding new servers and more instances of MySQL). Often paired with **availability** as critical aspects of a large-scale deployment.

See Also [availability](#), [scale out](#), [scale up](#).

### scale out

A technique for increasing **scalability** by adding new servers and more instances of MySQL. For example, setting up replication, MySQL Cluster, connection pooling, or other features that spread work across a group of servers. Contrast with **scale up**.

See Also [scalability](#), [scale up](#).

### scale up

A technique for increasing **scalability** by increasing the capacity of existing hardware or software. For example, increasing the memory on a server and adjusting memory-related parameters such as [innodb\\_buffer\\_pool\\_size](#) and [innodb\\_buffer\\_pool\\_instances](#). Contrast with **scale out**.

See Also [scalability](#), [scale out](#).

### schema

Conceptually, a schema is a set of interrelated database objects, such as tables, table columns, data types of the columns, indexes, foreign keys, and so on. These objects are connected through SQL syntax, because the columns make up the tables, the foreign keys refer to tables and columns, and so on. Ideally, they are also connected logically, working together as part of a unified application or flexible framework. For example, the **INFORMATION\_SCHEMA** and **performance\_schema** databases use “schema” in their names to emphasize the close relationships between the tables and columns they contain.

In MySQL, physically, a **schema** is synonymous with a **database**. You can substitute the keyword [SCHEMA](#) instead of [DATABASE](#) in MySQL SQL syntax, for example using [CREATE SCHEMA](#) instead of [CREATE DATABASE](#).

Some other database products draw a distinction. For example, in the Oracle Database product, a **schema** represents only a part of a database: the tables and other objects owned by a single user.

See Also [database](#), [INFORMATION\\_SCHEMA](#), [Performance Schema](#).

### search index

In MySQL, **full-text search** queries use a special kind of index, the **FULLTEXT index**. In MySQL 5.6.4 and up, [InnoDB](#) and [MyISAM](#) tables both support [FULLTEXT](#) indexes; formerly, these indexes were only available for [MyISAM](#) tables.

See Also [full-text search](#), [FULLTEXT index](#).

---

## secondary index

A type of [InnoDB index](#) that represents a subset of table columns. An [InnoDB](#) table can have zero, one, or many secondary indexes. (Contrast with the **clustered index**, which is required for each [InnoDB](#) table, and stores the data for all the table columns.)

A secondary index can be used to satisfy queries that only require values from the indexed columns. For more complex queries, it can be used to identify the relevant rows in the table, which are then retrieved through lookups using the clustered index.

Creating and dropping secondary indexes has traditionally involved significant overhead from copying all the data in the [InnoDB](#) table. The **fast index creation** feature makes both [CREATE INDEX](#) and [DROP INDEX](#) statements much faster for [InnoDB](#) secondary indexes.

See Also [clustered index](#), [Fast Index Creation](#), [index](#).

## segment

A division within an [InnoDB tablespace](#). If a tablespace is analogous to a directory, the segments are analogous to files within that directory. A segment can grow. New segments can be created.

For example, within a **file-per-table** tablespace, table data is in one segment and each associated index is in its own segment. The **system tablespace** contains many different segments, because it can hold many tables and their associated indexes. The system tablespace also includes one or more **rollback segments** used for **undo logs**.

Segments grow and shrink as data is inserted and deleted. When a segment needs more room, it is extended by one **extent** (1 megabyte) at a time. Similarly, a segment releases one extent's worth of space when all the data in that extent is no longer needed.

See Also [extent](#), [file-per-table](#), [rollback segment](#), [system tablespace](#), [tablespace](#), [undo log](#).

## selectivity

A property of data distribution, the number of distinct values in a column (its **cardinality**) divided by the number of records in the table. High selectivity means that the column values are relatively unique, and can be retrieved efficiently through an index. If you (or the query optimizer) can predict that a test in a [WHERE](#) clause only matches a small number (or proportion) of rows in a table, the overall **query** tends to be efficient if it evaluates that test first, using an index.

See Also [cardinality](#), [query](#).

## semi-consistent read

A type of read operation used for [UPDATE](#) statements, that is a combination of **READ COMMITTED** and **consistent read**. When an [UPDATE](#) statement examines a row that is already locked, [InnoDB](#) returns the latest committed version to MySQL so that MySQL can determine whether the row matches the [WHERE](#) condition of the [UPDATE](#). If the row matches (must be updated), MySQL reads the row again, and this time [InnoDB](#) either locks it or waits for a lock on it. This type of read operation can only happen when the transaction has the **READ COMMITTED isolation level**, or when the [innodb\\_locks\\_unsafe\\_for\\_binlog](#) option is enabled. [innodb\\_locks\\_unsafe\\_for\\_binlog](#) was removed in MySQL 8.0.

See Also [consistent read](#), [isolation level](#), [READ COMMITTED](#).

## SERIALIZABLE

The **isolation level** that uses the most conservative locking strategy, to prevent any other **transactions** from inserting or changing data that was read by this transaction, until it is finished. This way, the same query can be run over and over within a transaction, and be certain to retrieve the same set of results each time. Any attempt to change data that was committed by another transaction since the start of the current transaction, cause the current transaction to wait.

This is the default isolation level specified by the SQL standard. In practice, this degree of strictness is rarely needed, so the default isolation level for [InnoDB](#) is the next most strict, **REPEATABLE READ**.

See Also [ACID](#), [consistent read](#), [isolation level](#), [locking](#), [REPEATABLE READ](#), [transaction](#).

## server

A type of program that runs continuously, waiting to receive and act upon requests from another program (the **client**). Because often an entire computer is dedicated to running one or more server programs (such as

---

a database server, a web server, an application server, or some combination of these), the term **server** can also refer to the computer that runs the server software.  
See Also [client](#), [mysqld](#).

#### shared lock

A kind of **lock** that allows other **transactions** to read the locked object, and to also acquire other shared locks on it, but not to write to it. The opposite of **exclusive lock**.  
See Also [exclusive lock](#), [lock](#), [transaction](#).

#### shared tablespace

Another way of referring to the **system tablespace** or to a **general tablespace**. General tablespaces were introduced in MySQL 5.7  
See Also [general tablespace](#), [system tablespace](#).

#### sharp checkpoint

The process of **flushing** to disk all **dirty** buffer pool pages whose redo entries are contained in certain portion of the **redo log**. Occurs before [InnoDB](#) reuses a portion of a log file; the log files are used in a circular fashion. Typically occurs with write-intensive **workloads**.  
See Also [dirty page](#), [flush](#), [redo log](#), [workload](#).

#### shutdown

The process of stopping the MySQL server. By default, this process cleans up operations for **InnoDB** tables, so [InnoDB](#) can be **slow** to shut down, but fast to start up later. If you skip the cleanup operations, it is **fast** to shut down but the cleanup must be performed during the next restart.

The shutdown mode for [InnoDB](#) is controlled by the `innodb_fast_shutdown` option.  
See Also [fast shutdown](#), [InnoDB](#), [slow shutdown](#), [startup](#).

#### slave server

Frequently shortened to “slave”. A database **server** machine in a **replication** scenario that receives changes from another server (the **master**) and applies those same changes. Thus it maintains the same contents as the master, although it might lag somewhat behind.

In MySQL, slave servers are commonly used in disaster recovery, to take the place of a master servers that fails. They are also commonly used for testing software upgrades and new settings, to ensure that database configuration changes do not cause problems with performance or reliability.

Slave servers typically have high workloads, because they process all the **DML** (write) operations relayed from the master, as well as user queries. To ensure that slave servers can apply changes from the master fast enough, they frequently have fast I/O devices and sufficient CPU and memory to run multiple database instances on the same slave server. For example, the master server might use hard drive storage while the slave servers use **SSDs**.  
See Also [DML](#), [master server](#), [replication](#), [server](#), [SSD](#).

#### slow query log

A type of **log** used for performance tuning of SQL statements processed by the MySQL server. The log information is stored in a file. You must enable this feature to use it. You control which categories of “slow” SQL statements are logged. For more information, see [Section 6.4.5, “The Slow Query Log”](#).  
See Also [general query log](#), [log](#).

#### slow shutdown

A type of **shutdown** that does additional [InnoDB](#) flushing operations before completing. Also known as a **clean shutdown**. Specified by the configuration parameter `innodb_fast_shutdown=0` or the command `SET GLOBAL innodb_fast_shutdown=0;`. Although the shutdown itself can take longer, that time will be saved on the subsequent startup.  
See Also [clean shutdown](#), [fast shutdown](#), [shutdown](#).

#### snapshot

A representation of data at a particular time, which remains the same even as changes are **committed** by other **transactions**. Used by certain **isolation levels** to allow **consistent reads**.

---

See Also [commit](#), [consistent read](#), [isolation level](#), [transaction](#).

#### sort buffer

The buffer used for sorting data during creation of an [InnoDB](#) index. Sort buffer size is configured using the [innodb\\_sort\\_buffer\\_size](#) configuration option.

#### space ID

An identifier used to uniquely identify an [InnoDB](#) **tablespace** within a MySQL instance. The space ID for the **system tablespace** is always zero; this same ID applies to all tables within the system tablespace or within a general tablespace. Each **file-per-table** tablespace and **general tablespace** has its own space ID.

Prior to MySQL 5.6, this hardcoded value presented difficulties in moving [InnoDB](#) tablespace files between MySQL instances. Starting in MySQL 5.6, you can copy tablespace files between instances by using the **transportable tablespace** feature involving the statements [FLUSH TABLES ... FOR EXPORT](#), [ALTER TABLE ... DISCARD TABLESPACE](#), and [ALTER TABLE ... IMPORT TABLESPACE](#). The information needed to adjust the space ID is conveyed in the **.cfg file** which you copy along with the tablespace. See [Section 15.7.6, “Copying File-Per-Table Tablespaces to Another Server”](#) for details.

See Also [.cfg file](#), [file-per-table](#), [general tablespace](#), [.ibd file](#), [system tablespace](#), [tablespace](#), [transportable tablespace](#).

#### sparse file

A type of file that uses file system space more efficiently by writing metadata representing empty blocks to disk instead of writing the actual empty space. The [InnoDB](#) **transparent page compression** feature relies on sparse file support. For more information, see [Section 15.9.2, “InnoDB Page Compression”](#).

See Also [hole punching](#), [transparent page compression](#).

#### spin

A type of **wait** operation that continuously tests whether a resource becomes available. This technique is used for resources that are typically held only for brief periods, where it is more efficient to wait in a “busy loop” than to put the thread to sleep and perform a context switch. If the resource does not become available within a short time, the spin loop ceases and another wait technique is used.

See Also [latch](#), [lock](#), [mutex](#), [wait](#).

#### SQL

The Structured Query Language that is standard for performing database operations. Often divided into the categories **DDL**, **DML**, and **queries**. MySQL includes some additional statement categories such as **replication**. See [Chapter 10, Language Structure](#) for the building blocks of SQL syntax, [Chapter 12, Data Types](#) for the data types to use for MySQL table columns, [Chapter 14, SQL Statement Syntax](#) for details about SQL statements and their associated categories, and [Chapter 13, Functions and Operators](#) for standard and MySQL-specific functions to use in queries.

See Also [DDL](#), [DML](#), [query](#), [replication](#).

#### SSD

Acronym for “solid-state drive”. A type of storage device with different performance characteristics than a traditional hard disk drive (**HDD**): smaller storage capacity, faster for random reads, no moving parts, and with a number of considerations affecting write performance. Its performance characteristics can influence the throughput of a **disk-bound** workload.

See Also [disk-bound](#), [HDD](#).

#### startup

The process of starting the MySQL server. Typically done by one of the programs listed in [Section 5.3, “MySQL Server and Server-Startup Programs”](#). The opposite of **shutdown**.

See Also [shutdown](#).

#### statement-based replication

A form of **replication** where SQL statements are sent from the **master server** and replayed on the **slave server**. It requires some care with the setting for the [innodb\\_autoinc\\_lock\\_mode](#) option, to avoid potential timing problems with **auto-increment locking**.

See Also [auto-increment locking](#), [innodb\\_autoinc\\_lock\\_mode](#), [master server](#), [replication](#), [row-based replication](#), [slave server](#).

---

## statistics

Estimated values relating to each [InnoDB table](#) and **index**, used to construct an efficient **query execution plan**. The main values are the **cardinality** (number of distinct values) and the total number of table rows or index entries. The statistics for the table represent the data in its **primary key** index. The statistics for a **secondary index** represent the rows covered by that index.

The values are estimated rather than counted precisely because at any moment, different **transactions** can be inserting and deleting rows from the same table. To keep the values from being recalculated frequently, you can enable **persistent statistics**, where the values are stored in [InnoDB](#) system tables, and refreshed only when you issue an [ANALYZE TABLE](#) statement.

You can control how **NULL** values are treated when calculating statistics through the [innodb\\_stats\\_method](#) configuration option.

Other types of statistics are available for database objects and database activity through the **INFORMATION\_SCHEMA** and **PERFORMANCE\_SCHEMA** tables.

See Also [cardinality](#), [index](#), [INFORMATION\\_SCHEMA](#), [NULL](#), [Performance Schema](#), [persistent statistics](#), [primary key](#), [query execution plan](#), [secondary index](#), [table](#), [transaction](#).

## stemming

The ability to search for different variations of a word based on a common root word, such as singular and plural, or past, present, and future verb tense. This feature is currently supported in [MyISAM full-text search](#) feature but not in **FULLTEXT indexes** for [InnoDB](#) tables.

See Also [full-text search](#), [FULLTEXT index](#).

## stopword

In a **FULLTEXT index**, a word that is considered common or trivial enough that it is omitted from the **search index** and ignored in search queries. Different configuration settings control stopwords processing for [InnoDB](#) and [MyISAM](#) tables. See [Section 13.9.4, “Full-Text Stopwords”](#) for details.

See Also [FULLTEXT index](#), [search index](#).

## storage engine

A component of the MySQL database that performs the low-level work of storing, updating, and querying data. In MySQL 5.5 and higher, **InnoDB** is the default storage engine for new tables, superseding [MyISAM](#). Different storage engines are designed with different tradeoffs between factors such as memory usage versus disk usage, read speed versus write speed, and speed versus robustness. Each storage engine manages specific tables, so we refer to [InnoDB](#) tables, [MyISAM](#) tables, and so on.

The **MySQL Enterprise Backup** product is optimized for backing up [InnoDB](#) tables. It can also back up tables handled by [MyISAM](#) and other storage engines.

See Also [InnoDB](#), [MySQL Enterprise Backup](#), [table type](#).

## strict mode

The general name for the setting controlled by the [innodb\\_strict\\_mode](#) option. Turning on this setting causes certain conditions that are normally treated as warnings, to be considered errors. For example, certain invalid combinations of options related to **file format** and **row format**, that normally produce a warning and continue with default values, now cause the [CREATE TABLE](#) operation to fail. [innodb\\_strict\\_mode](#) is enabled by default in MySQL 5.7.

MySQL also has something called strict mode.

See Also [file format](#), [innodb\\_strict\\_mode](#), [row format](#).

## sublist

Within the list structure that represents the **buffer pool**, pages that are relatively old and relatively new are represented by different portions of the **list**. A set of parameters control the size of these portions and the dividing point between the new and old pages.

See Also [buffer pool](#), [eviction](#), [list](#), [LRU](#).

## supremum record

A **pseudo-record** in an index, representing the **gap** above the largest value in that index. If a transaction has a statement such as [SELECT ... FROM ... WHERE col > 10 FOR UPDATE;](#), and the largest value

---

in the column is 20, it is a lock on the supremum record that prevents other transactions from inserting even larger values such as 50, 100, and so on.

See Also [gap](#), [infimum record](#), [pseudo-record](#).

#### surrogate key

Synonym name for **synthetic key**.

See Also [synthetic key](#).

#### synthetic key

An indexed column, typically a **primary key**, where the values are assigned arbitrarily. Often done using an **auto-increment** column. By treating the value as completely arbitrary, you can avoid overly restrictive rules and faulty application assumptions. For example, a numeric sequence representing employee numbers might have a gap if an employee was approved for hiring but never actually joined. Or employee number 100 might have a later hiring date than employee number 500, if they left the company and later rejoined. Numeric values also produce shorter values of predictable length. For example, storing numeric codes meaning “Road”, “Boulevard”, “Expressway”, and so on is more space-efficient than repeating those strings over and over.

Also known as a **surrogate key**. Contrast with **natural key**.

See Also [auto-increment](#), [natural key](#), [primary key](#), [surrogate key](#).

#### system tablespace

One or more data files (**ibdata files**) containing metadata for [InnoDB](#)-related objects (the [InnoDB data dictionary](#)), and the storage areas for one or more **undo logs**, the **change buffer**, and the **doublewrite buffer**. It may also contain table and index data for [InnoDB](#) tables if tables were created in the system tablespace instead of **file-per-table** or **general tablespaces**. The data and metadata in the system tablespace apply to all **databases** in a MySQL instance.

Prior to MySQL 5.6.7, the default was to keep all [InnoDB](#) tables and indexes inside the system tablespace, often causing this file to become very large. Because the system tablespace never shrinks, storage problems could arise if large amounts of temporary data were loaded and then deleted. In MySQL 5.7, the default is **file-per-table** mode, where each table and its associated indexes are stored in a separate **.ibd file**. This new default makes it easier to use [InnoDB](#) features that rely on the **Barracuda** file format, such as table **compression**, efficient storage of **off-page columns**, and large index key prefixes ([innodb\\_large\\_prefix](#)).

The [innodb\\_undo\\_tablespaces](#) option allows you to configure separate tablespace files for undo logs. These files are still considered part of the system tablespace.

Keeping all table data in the system tablespace or in separate [.ibd](#) files has implications for storage management in general. The **MySQL Enterprise Backup** product might back up a small set of large files, or many smaller files. On systems with thousands of tables, the file system operations to process thousands of [.ibd](#) files can cause bottlenecks.

[InnoDB](#) introduced general tablespaces in MySQL 5.7.6, which are also represented by [.ibd](#) files. General tablespaces are shared tablespaces created using [CREATE TABLESPACE](#) syntax. They can be created outside of the MySQL data directory, are capable of holding multiple tables, and support tables of all row formats.

See Also [Barracuda](#), [change buffer](#), [compression](#), [data dictionary](#), [database](#), [doublewrite buffer](#), [dynamic row format](#), [file-per-table](#), [general tablespace](#), [.ibd file](#), [ibdata file](#), [innodb\\_file\\_per\\_table](#), [instance](#), [MySQL Enterprise Backup](#), [off-page column](#), [tablespace](#), [undo log](#).

## T

#### .TRG file

A file containing trigger parameters. Files with this extension are always included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product.

See Also [MySQL Enterprise Backup](#), [mysqlbackup command](#), [.TRN file](#).

---

## .TRN file

A file containing trigger namespace information. Files with this extension are always included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product.

See Also [MySQL Enterprise Backup](#), [mysqlbackup command](#), [.TRG file](#).

## table

Each MySQL table is associated with a particular **storage engine**. **InnoDB** tables have particular **physical** and **logical** characteristics that affect performance, **scalability**, **backup**, administration, and application development.

In terms of file storage, an **InnoDB** table belongs to one of the following tablespace types:

- The shared **InnoDB system tablespace**, which is comprised of one or more **ibdata files**.
- A **file-per-table** tablespace, comprised of an individual **.ibd file**.
- A shared **general tablespace**, comprised of an individual **.ibd** file. General tablespaces were introduced in MySQL 5.7.6.

**.ibd** data files contain both table and **index** data.

**InnoDB** tables created in file-per-table tablespaces can use the **Barracuda** file format, and Barracuda tables can use **DYNAMIC** or **COMPRESSED** row format. These row formats enable **InnoDB** features such as **compression**, efficient storage of **off-page columns**, and large index key prefixes (see [innodb\\_large\\_prefix](#)). General tablespaces support all row formats regardless of the [innodb\\_file\\_format](#) setting.

Up to MySQL 5.7.5, **InnoDB** tables inside the system tablespace had to use the **Antelope** file format for backward compatibility with MySQL 5.1 and earlier. The **Antelope** file format supports **COMPACT** and **REDUNDANT** row format. The system tablespace supports tables that use **DYNAMIC** row format as of MySQL 5.7.6.

The **rows** of an **InnoDB** table are organized into an index structure known as the **clustered index**, with entries sorted based on the **primary key** columns of the table. Data access is optimized for queries that filter and sort on the primary key columns, and each index contains a copy of the associated primary key columns for each entry. Modifying values for any of the primary key columns is an expensive operation. Thus an important aspect of **InnoDB** table design is choosing a primary key with columns that are used in the most important queries, and keeping the primary key short, with rarely changing values.

See Also [Antelope](#), [backup](#), [Barracuda](#), [clustered index](#), [compact row format](#), [compressed row format](#), [compression](#), [dynamic row format](#), [Fast Index Creation](#), [file-per-table](#), [.ibd file](#), [index](#), [off-page column](#), [primary key](#), [redundant row format](#), [row](#), [system tablespace](#), [tablespace](#).

## table lock

A lock that prevents any other **transaction** from accessing a table. **InnoDB** makes considerable effort to make such locks unnecessary, by using techniques such as **online DDL**, **row locks** and **consistent reads** for processing **DML** statements and **queries**. You can create such a lock through SQL using the [LOCK TABLE](#) statement; one of the steps in migrating from other database systems or MySQL storage engines is to remove such statements wherever practical.

See Also [consistent read](#), [DML](#), [lock](#), [locking](#), [online DDL](#), [query](#), [row lock](#), [table](#), [transaction](#).

## table scan

See [full table scan](#).

## table statistics

See [statistics](#).

## table type

Obsolete synonym for **storage engine**. We refer to **InnoDB** tables, **MyISAM** tables, and so on.

See Also [InnoDB](#), [storage engine](#).

## tablespace

A data file that can hold data for one or more **InnoDB tables** and associated **indexes**.

---

The **system tablespace** contains the **InnoDB data dictionary**, and prior to MySQL 5.6 holds all other **InnoDB** tables by default.

The `innodb_file_per_table` option, enabled by default in MySQL 5.6 and higher, allows tables to be created in their own tablespaces. File-per-table tablespaces support features such as efficient storage of **off-page columns**, table compression, and transportable tablespaces. See [Section 15.7.4, “InnoDB File-Per-Table Tablespaces”](#) for details.

**InnoDB** introduced general tablespaces in MySQL 5.7.6. General tablespaces are shared tablespaces created using `CREATE TABLESPACE` syntax. They can be created outside of the MySQL data directory, are capable of holding multiple tables, and support tables of all row formats.

MySQL Cluster also groups its tables into tablespaces. See [Section 20.5.13.1, “NDB Cluster Disk Data Objects”](#) for details.

See Also [compressed row format](#), [data dictionary](#), [data files](#), [file-per-table](#), [general tablespace](#), [index](#), [innodb\\_file\\_per\\_table](#), [system tablespace](#), [table](#).

#### tablespace dictionary

A representation of the **data dictionary** metadata for a table, within the **InnoDB tablespace**. This metadata can be checked against the **.frm file** for consistency when the table is opened, to diagnose errors resulting from out-of-date **.frm** files. This information is present for **InnoDB** tables that reside in the **system tablespace**, a **file-per-table** tablespace, or a general tablespace.

See Also [data dictionary](#), [file-per-table](#), [.frm file](#), [general tablespace](#), [.ibd file](#), [system tablespace](#), [tablespace](#).

#### temporary table

A **table** whose data does not need to be truly permanent. For example, temporary tables might be used as storage areas for intermediate results in complicated calculations or transformations; this intermediate data would not need to be recovered after a crash. Database products can take various shortcuts to improve the performance of operations on temporary tables, by being less scrupulous about writing data to disk and other measures to protect the data across restarts.

Sometimes, the data itself is removed automatically at a set time, such as when the transaction ends or when the session ends. With some database products, the table itself is removed automatically too.

See Also [table](#).

#### temporary tablespace

The tablespace for non-compressed **InnoDB temporary tables** and related objects, introduced in MySQL 5.7.1. The configuration file option, `innodb_temp_data_file_path`, allows users to define a relative path for the temporary tablespace data file. If `innodb_temp_data_file_path` is not specified, the default behavior is to create a single auto-extending 12MB data file named `ibtmp1` in the data directory, alongside the **system tablespace** files. The temporary tablespace is recreated on each server start and receives a dynamically generated **space ID**, which helps avoid conflicts with existing space IDs. The temporary tablespace cannot reside on a raw device. Startup is refused if the temporary tablespace cannot be created.

The temporary tablespace is removed on normal shutdown or on an aborted initialization. The temporary tablespace is not removed when a crash occurs. In this case, the database administrator may remove the temporary tablespace manually or restart the server with the same configuration, which removes and recreates the temporary tablespace.

See Also [ibtmp file](#), [space ID](#), [system tablespace](#), [temporary table](#).

#### text collection

The set of columns included in a **FULLTEXT index**.

See Also [FULLTEXT index](#).

#### thread

A unit of processing that is typically more lightweight than a **process**, allowing for greater **concurrency**.

See Also [concurrency](#), [master thread](#), [process](#), [Pthreads](#).

#### torn page

An error condition that can occur due to a combination of I/O device configuration and hardware failure. If data is written out in chunks smaller than the **InnoDB page size** (by default, 16KB), a hardware failure

---

while writing could result in only part of a page being stored to disk. The [InnoDB doublewrite buffer](#) guards against this possibility.

See Also [doublewrite buffer](#).

## TPS

Acronym for “**transactions** per second”, a unit of measurement sometimes used in benchmarks. Its value depends on the **workload** represented by a particular benchmark test, combined with factors that you control such as the hardware capacity and database configuration.

See Also [transaction](#), [workload](#).

## transaction

Transactions are atomic units of work that can be **committed** or **rolled back**. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

Database transactions, as implemented by [InnoDB](#), have properties that are collectively known by the acronym **ACID**, for atomicity, consistency, isolation, and durability.

See Also [ACID](#), [commit](#), [isolation level](#), [lock](#), [rollback](#).

## transaction ID

An internal field associated with each **row**. This field is physically changed by [INSERT](#), [UPDATE](#), and [DELETE](#) operations to record which **transaction** has locked the row.

See Also [implicit row lock](#), [row](#), [transaction](#).

## transparent page compression

A feature added in MySQL 5.7.8 that permits page-level compression for [InnoDB](#) tables that reside in **file-per-table** tablespaces. Page compression is enabled by specifying the [COMPRESSION](#) attribute with [CREATE TABLE](#) or [ALTER TABLE](#). For more information, see [Section 15.9.2, “InnoDB Page Compression”](#).

See Also [file-per-table](#), [hole punching](#), [sparse file](#).

## transportable tablespace

A feature that allows a **tablespace** to be moved from one instance to another. Traditionally, this has not been possible for [InnoDB](#) tablespaces because all table data was part of the **system tablespace**. In MySQL 5.6 and higher, the [FLUSH TABLES ... FOR EXPORT](#) syntax prepares an [InnoDB](#) table for copying to another server; running [ALTER TABLE ... DISCARD TABLESPACE](#) and [ALTER TABLE ... IMPORT TABLESPACE](#) on the other server brings the copied data file into the other instance. A separate **.cfg file**, copied along with the **.ibd file**, is used to update the table metadata (for example the **space ID**) as the tablespace is imported. See [Section 15.7.6, “Copying File-Per-Table Tablespaces to Another Server”](#) for usage information.

See Also [.cfg file](#), [.ibd file](#), [space ID](#), [system tablespace](#), [tablespace](#).

## troubleshooting

The process of determining the source of a problem. Some of the resources for troubleshooting MySQL problems include:

- [Section 2.10.2.1, “Troubleshooting Problems Starting the MySQL Server”](#)
- [Section 7.2.7, “Troubleshooting Problems Connecting to MySQL”](#)
- [Section B.5.3.2, “How to Reset the Root Password”](#)
- [Section B.5.2, “Common Errors When Using MySQL Programs”](#)
- [Section 15.21, “InnoDB Troubleshooting”](#).

## truncate

A **DDL** operation that removes the entire contents of a table, while leaving the table and related indexes intact. Contrast with **drop**. Although conceptually it has the same result as a [DELETE](#) statement with no [WHERE](#) clause, it operates differently behind the scenes: [InnoDB](#) creates a new empty table, drops the old table, then renames the new table to take the place of the old one. Because this is a DDL operation, it cannot be **rolled back**.

---

If the table being truncated contains **foreign keys** that reference another table, the truncation operation uses a slower method of operation, deleting one row at a time so that corresponding rows in the referenced table can be deleted as needed by any [ON DELETE CASCADE](#) clause. (MySQL 5.5 and higher do not allow this slower form of truncate, and return an error instead if foreign keys are involved. In this case, use a [DELETE](#) statement instead.

See Also [DDL](#), [drop](#), [foreign key](#), [rollback](#).

#### tuple

A technical term designating an ordered set of elements. It is an abstract notion, used in formal discussions of database theory. In the database field, tuples are usually represented by the columns of a table row. They could also be represented by the result sets of queries, for example, queries that retrieved only some columns of a table, or columns from joined tables.

See Also [cursor](#).

#### two-phase commit

An operation that is part of a distributed **transaction**, under the **XA** specification. (Sometimes abbreviated as 2PC.) When multiple databases participate in the transaction, either all databases **commit** the changes, or all databases **roll back** the changes.

See Also [commit](#), [rollback](#), [transaction](#), [XA](#).

## U

#### undo

Data that is maintained throughout the life of a **transaction**, recording all changes so that they can be undone in case of a **rollback** operation. It is stored in the **undo log** either within the **system tablespace** or in separate **undo tablespaces**.

See Also [rollback](#), [rollback segment](#), [system tablespace](#), [transaction](#), [undo log](#), [undo tablespace](#).

#### undo buffer

See [undo log](#).

#### undo log

A storage area that holds copies of data modified by active **transactions**. If another transaction needs to see the original data (as part of a **consistent read** operation), the unmodified data is retrieved from this storage area.

By default, this area is physically part of the **system tablespace**. In MySQL 5.6 and higher, you can use the [innodb\\_undo\\_tablespaces](#) and [innodb\\_undo\\_directory](#) configuration options to split it into one or more separate **tablespace** files, the **undo tablespaces**, optionally stored on another storage device such as an **SSD**.

The undo log is split into separate portions, the **insert undo buffer** and the **update undo buffer**.

See Also [consistent read](#), [rollback segment](#), [SSD](#), [system tablespace](#), [transaction](#), [undo tablespace](#).

#### undo log segment

A collection of **undo logs**. Undo log segments exists within **rollback segments**. An undo log segment might contain undo logs from multiple transactions. An undo log segment can only be used by one transaction at a time but can be reused after it is released at transaction **commit** or **rollback**. May also be referred to as an “undo segment”.

See Also [commit](#), [rollback](#), [rollback segment](#), [undo log](#).

#### undo tablespace

An undo tablespace comprises one or more files that contain **undo logs**. Undo logs exist within **undo log segments**, which are contained within **rollback segments**. By default, rollback segments are physically part of the **system tablespace**. However, rollback segments can reside in separate undo tablespaces.

An undo tablespace is created when the undo log is separated from the system tablespace using the [innodb\\_undo\\_tablespaces](#) and [innodb\\_undo\\_directory](#) configuration options. Undo tablespaces were introduced in MySQL 5.6.

For more information, see [Section 15.7.7, “Storing InnoDB Undo Logs in Separate Tablespaces”](#).

---

See Also [rollback segment](#), [system tablespace](#), [undo log](#), [undo log segment](#).

#### unique constraint

A kind of **constraint** that asserts that a column cannot contain any duplicate values. In terms of **relational algebra**, it is used to specify 1-to-1 relationships. For efficiency in checking whether a value can be inserted (that is, the value does not already exist in the column), a unique constraint is supported by an underlying **unique index**.

See Also [constraint](#), [relational](#), [unique index](#).

#### unique index

An index on a column or set of columns that have a **unique constraint**. Because the index is known not to contain any duplicate values, certain kinds of lookups and count operations are more efficient than in the normal kind of index. Most of the lookups against this type of index are simply to determine if a certain value exists or not. The number of values in the index is the same as the number of rows in the table, or at least the number of rows with non-null values for the associated columns.

**Change buffering** optimization does not apply to unique indexes. As a workaround, you can temporarily set `unique_checks=0` while doing a bulk data load into an [InnoDB](#) table.

See Also [cardinality](#), [change buffering](#), [unique constraint](#), [unique key](#).

#### unique key

The set of columns (one or more) comprising a **unique index**. When you can define a [WHERE](#) condition that matches exactly one row, and the query can use an associated unique index, the lookup and error handling can be performed very efficiently.

See Also [cardinality](#), [unique constraint](#), [unique index](#).

## V

#### variable-length type

A data type of variable length. [VARCHAR](#), [VARBINARY](#), and [BLOB](#) and [TEXT](#) types are variable-length types.

[InnoDB](#) treats fixed-length fields greater than or equal to 768 bytes in length as variable-length fields, which can be stored **off-page**. For example, a `CHAR(255)` column can exceed 768 bytes if the maximum byte length of the character set is greater than 3, as it is with `utf8mb4`.

See Also [off-page column](#), [overflow page](#).

#### victim

The **transaction** that is automatically chosen to be **rolled back** when a **deadlock** is detected. [InnoDB](#) rolls back the transaction that has updated the fewest rows.

**Deadlock detection** can be disabled using the `innodb_deadlock_detect` configuration option.

See Also [deadlock](#), [deadlock detection](#), [innodb\\_lock\\_wait\\_timeout](#), [transaction](#).

#### virtual column

See [generated virtual column](#).

#### virtual index

A virtual index is a **secondary index** on one or more **generated virtual columns** or on a combination of virtual columns and regular columns or generated stored columns. For more information, see [Section 14.1.18.8, “Secondary Indexes and Generated Columns”](#).

See Also [generated stored column](#), [generated virtual column](#), [secondary index](#).

## W

#### wait

When an operation, such as acquiring a **lock**, **mutex**, or **latch**, cannot be completed immediately, [InnoDB](#) pauses and tries again. The mechanism for pausing is elaborate enough that this operation has its own name, the **wait**. Individual threads are paused using a combination of internal [InnoDB](#) scheduling, operating system `wait()` calls, and short-duration **spin** loops.

---

On systems with heavy load and many transactions, you might use the output from the [SHOW INNODB STATUS](#) command or **Performance Schema** to determine whether threads are spending too much time waiting, and if so, how you can improve **concurrency**.

See Also [concurrency](#), [latch](#), [lock](#), [mutex](#), [Performance Schema](#), [spin](#).

#### warm backup

A **backup** taken while the database is running, but that restricts some database operations during the backup process. For example, tables might become read-only. For busy applications and web sites, you might prefer a **hot backup**.

See Also [backup](#), [cold backup](#), [hot backup](#).

#### warm up

To run a system under a typical **workload** for some time after startup, so that the **buffer pool** and other memory regions are filled as they would be under normal conditions. This process happens naturally over time when a MySQL server is restarted or subjected to a new workload.

Typically, you run a workload for some time to warm up the buffer pool before running performance tests, to ensure consistent results across multiple runs; otherwise, performance might be artificially low during the first run.

In MySQL 5.6, you can speed up the warmup process by enabling the [innodb\\_buffer\\_pool\\_dump\\_at\\_shutdown](#) and [innodb\\_buffer\\_pool\\_load\\_at\\_startup](#) configuration options, to bring the contents of the buffer pool back into memory after a restart. These options are enabled by default in MySQL 5.7. See [Section 15.6.3.8, “Saving and Restoring the Buffer Pool State”](#). See Also [buffer pool](#), [workload](#).

#### workload

The combination and volume of **SQL** and other database operations, performed by a database application during typical or peak usage. You can subject the database to a particular workload during performance testing to identify **bottlenecks**, or during capacity planning.

See Also [bottleneck](#), [CPU-bound](#), [disk-bound](#), [SQL](#).

#### write combining

An optimization technique that reduces write operations when **dirty pages** are **flushed** from the [InnoDB buffer pool](#). If a row in a page is updated multiple times, or multiple rows on the same page are updated, all of those changes are stored to the data files in a single write operation rather than one write for each change. See Also [buffer pool](#), [dirty page](#), [flush](#).

## X

#### XA

A standard interface for coordinating distributed **transactions**, allowing multiple databases to participate in a transaction while maintaining **ACID** compliance. For full details, see [Section 14.3.7, “XA Transactions”](#).

XA Distributed Transaction support is enabled by default. If you are not using this feature, you can disable the [innodb\\_support\\_xa](#) configuration option, avoiding the performance overhead of an extra fsync for each transaction.

As of MySQL 5.7.10, disabling [innodb\\_support\\_xa](#) is not permitted as it makes replication unsafe and prevents performance gains associated with **binary log** group commit. The [innodb\\_support\\_xa](#) configuration option is removed in MySQL 8.0.

See Also [ACID](#), [binary log](#), [commit](#), [transaction](#), [two-phase commit](#).

## Y

#### young

A characteristic of a **page** in the [InnoDB buffer pool](#) meaning it has been accessed recently, and so is moved within the buffer pool data structure, so that it will not be **flushed** soon by the **LRU** algorithm. This term is used in some **INFORMATION\_SCHEMA** column names of tables related to the buffer pool.

---

See Also [buffer pool](#), [flush](#), [INFORMATION\\_SCHEMA](#), [LRU](#), [page](#).
